Mini-Workshop for Overload Enforcement in MPWT

Mini-workshop for Overload Enforcement was held on 02 October, 2015.

The workshop took following three themes;

- 1) General prospect of Overload Enforce program
- 2) Site investigation of enforcement in Cambodia
- 3) Site consideration at Tsukuba Bridge

JICA expert presented a concept and an implementation program on overload enforcement, on the other hand, Cambodia side explains the status quo of overloading reinforcement in MPWT. Following to this, free discussion was made between the two to achieve the common goal, overloading enforcement at Tsubasa Bridge.

Workshop was held on 27th October, when three options at Tsubasa Bridge against overloading countermeasures were introduced (Fig. 1, 2). From MPWT side, preferences were addressed to early implementation program. Countermeasures that do not include local measures were preferred such as option2 (Fig.3, 4). At the same time, future increase of traffic demand should be taken into account. It is also stressed the mal-function experience of HSWIM management should be addressed not to repeat the error.
