I. National poverty information and basic information

1.1 Data for poverty analysis

The National Directorate of Studies and Policy Analysis (DNEP) in Ministry of Planning and Development (MPD) is designated as the authority to take charge of setting poverty lines and monitoring the poverty situation in Mozambique. One of the main tasks of MPD is to analyze the poverty situation based on data and information collected by the Household surveys¹ of the Instituto Nacional de Estatística (INE) every five years and various data source collected by donor organizations. The analysis has been technically assisted by research institutions. MPD has published three reports since the end of Civil War and the recent report, “Understanding Poverty and Well-being in Mozambique: Third National Poverty Assessment” was published with the collaboration of University of Copenhagen in October 2010. This study aims at understanding the poverty level in Mozambique over a dynamic time line, identifying the people living in poverty and finding the background of it. Thus, in addition to the field trip to Mozambique, the study makes use of the following publications (published by the Mozambique government), “Understanding Poverty and Well-being in Mozambique” and “Report on the Millennium Development Goals”. Moreover, the study refers to various statistic data posted in INE web site, “Multiple Indicator Cluster Survey” of UNICEF, “Comprehensive Food Security and Vulnerability Analysis” of WFP, World Economic Outlook Database of IMF and other available data.

1.2 National Poverty Information

1.2.1 Macroeconomic Indicators and Poverty Indicators

The macroeconomic indicators and the poverty related index of Mozambique are as follows:

¹ INE has conducted surveys three times in 1996/97, 2002/03 and 2008/09. It was changed its name to Household Survey in 2008/09.

Table1-1 Macroeconomic indicators and a poverty related index (1999-2010)

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
Real GDP (million US\$)	6,597	5,417	4,607	4,404	4,666	5,302	5,627	5,645	5,917	6,686	6,442	5,748

The poverty gap index of people who live for 1.25 dollars or less per day												
Poverty gap index				20.5						21.2		
Gini coefficient				0.415						0.414		
Adult literacy (%)					46.4					49.7		
The number of HIV/AIDS infected persons										1,600,000	1,600,000	1,700,000
Gender unequal index										0.718		

Source: Real GDP, nominal GDP, current balance, and current balance versus GDP ratio and population are from "World Economic Outlook Database" of IMF.

Per capita GDP, a GDP growth rate, an inflation rate, and adult literacy are from Republic of Mozambique (2010) "Report on the Development Goals".

The population below a population growth rate and a poverty line, a poverty gap index, Gini coefficient is MPD (2010)"Understanding Poverty and Well-being Mozambique. : Third National Poverty Assessment"

HDI and a gender unequal index are from Republic of Mozambique (2010) "Human Development Report".

Life expectancy and the number of HIV/AIDS infected persons are INE homepages at the time of birth.

1.2.2 Basic Information

The following is the basic social information for Mozambique, and its features:

(1) National Territory:

Area is 799 390 square meter. It is divided into three areas; north, central, and south.

- Carbo Delgado, Niassa, and Nampula provinces belong to the north area
- Zambezia, Tete, Manica, and Sofala provinces are in the central area
- Inhambane, Gaza, Maputo and Maputo city are in the south

² The IMF World Economic Outlook Database 2010: The data in 2009 and 2010 is predicted figure.

³ Ibid.

⁴ Ibid.

⁵ For more details, please refer to <http://hdrstats.undp.org/en/countries/profiles/MOZ.html>

(2) Geographical Information:

Mozambique is located at 12 degree south latitude and longitude 40 east.

(3) Religion⁶:

- 28.4 percent Christian
- 17.9 percent Muslim
- 15.5 percent Jewish
- 6.7 percent non-religious
- 18.7 percent others

(4) Poverty Index:

The Mozambique government has set up the original national poverty line (3.1.1 reference for details). The globally accepted definition of poverty is to live below 1.25 dollar per day. This definition is not commonly used in Mozambique.

(5) Population:

In 2010, the population was 21 585 000. In 2007, the population growth rate was 2.7 percent. The largest province is Nampula with a population of approximately 4 million. A unique phenomenon in Mozambique is slow urbanization. The population ratio of the capital city, Maputo to total population has fallen from 6. percent in 1997, 5.4 percent in 2007 and 5.1 percent in 2011 as Table 1-2 indicates. A feature of the population of Tete province (which produces coal) is that it is increasing.

⁶ Census (2007)

Table1-2 Population by Regions and Provinces (1997-2011)⁷

	Population (1,000 persons)			Share (%)		
	1997	2007	2011

Source: INE

<http://www.ine.gov.mz/populacao/indicadores/Document.2010-10-28.6332667779>

(6) Economic situation:

This chapter highlights the economic policies and overviews after achieving independence.

- the GDP per capita was 453.8 US dollar in 2008
- its annual growth rate was 6.4 percent in 2009
- the official unemployment rate was 18.7% in 2004/05⁸
- the inflation rate in 2010 is 16.6 percent

The economic policy changed drastically since its independence. Initially, the socialist economic system was adopted. However, the accession to the World Bank and International Monetary Fund (IMF) shifted economic policy to adopt the free market economy. In 1987, the government of Mozambique undertook structural adjustment programmes. Mozambique then went through a civil war. After a long and devastating civil war, the economy started to recover amid democratization to the point where it is currently achieving economic growth of between 6 to 10 percent - as the Table1-1 shows. The impact of the global financial crisis of 2008 has had a limited impact on Mozambique.

The three industries that have been behind the revival of the Mozambique economy are,

⁷ The data in 2011 is expectancy

⁸ <http://www.ine.gov.mz/populacao/fttab/Document.2006-06-30.7286596895>

agriculture, manufacturing and trading. The agriculture industry is considered to absorb in 80 percent of the employed workforce in Mozambique and contributes 27 percent of total GDP. Cotton, cashew nuts and sugar are the main export products and an important source of foreign currency. Any slump of agricultural exports due to bad weather has a negative impact on the Mozambique economy. In particular, the impact to agriculture-dependent provinces such as Zambezia and Sofala provinces is strong and the performance of the agriculture sector affects their economic strength. Mozambique is considered to be rich in large tracts of fertile land and it is said that there is huge growth potential in the agriculture industry. In reality, despite huge investment inflows from Brazil and South Africa, only 10 percent of cultivatable land in Mozambique is utilized for farming⁹. After agriculture, the manufacturing industry contributes 14 percent to GDP and the trading industry contributes 13 percent to GDP. However, both industries are active only in and around Maputo City.

Foreign Direct Investment (FDI) in the manufacturing and mining sectors has boomed but the impact of FDI has been limited. As Table 1-3 overleaf shows, its contribution to the GDP was a mere 1.6 percent in 2008. In addition, as the FDI inflows concentrate on the free economic zone, it does not help to increase tax revenue.

Table1-3 GDP ratio classified by sector (2005 and 2008) (unit: %)

Sector	2005	2008
Agriculture	19.7	27.4
Manufacturing industry	12.8	14.5
Trade	21.2	13.2
Finance and business service	3.3	11.1
Transportation and communication	16.4	10.7
Public service	6.6	9.2
Electricity and water service	5.9	6.2
Construction industry	12.8	2.9
Other services	5.4	1.7
Mining and the quarrying industry	0.9	1.6
Hotel restaurant	1.2	1.6

Source: Create by AfDB/OECD African Economic Outlook and other data

(7) Donor activity

Mozambique is one of the countries where donors' coordination is the most active in Africa. Currently, 19 donors - called G19 or PAPs (Program Support Partner)¹⁰ - implement general budgetary support (GBS). One of the functions of PAPs is to conduct a Performance Assessment Framework (PAF) under the framework of PARPA (details are explained in

⁹ Ministry of Foreign Affairs (2008) "ODA Evaluation in Mozambique"

¹⁰ G19 includes Germany, Belgium, Denmark, Britain, Italy, Finland, France, Ireland, Norway, the Netherlands, Portugal, Sweden, Switzerland, Canada, Spain, Austria, the World Bank, EU, and African Development Bank.

Chapter 7). The Mozambique government and PAPs have reviewed poverty reduction progress and updated PAF every year. On the other hand, Japan, USA, and UN organizations, which mainly implement project-based assistance in Mozambique, are called non-PAPs, face difficulties to keep regular communication with the Mozambique government.

Table 1-4 overleaf shows various forms (assistance modality) of assistance from 2005 to 2010 in Mozambique. The amount of project-based assistance contributes approximately 50 percent of total assistance to Mozambique and GBS and SWAPs have been consistent in the five years.

In addition, Chinese assistance, which is not included in the Table, has been increasing rapidly. It focuses on loan and technical assistance as well as investment¹¹. It varies from social development projects, such as school construction and water facility construction to military assistance. Chinese investment has been active and ranked as 2nd investor after South Africa in 2008. It amounted to 7.7 million US dollar¹². It is observed that there are many buildings constructed by China in Maputo city. Those investments should contribute to the economic growth in Mozambique.

Table1-4: The record on assistance form for Mozambique by modality (2005-2011)

	2006	2007	2008	2009	2010	2011

Note: Unit is of % and total amount is USD. The data after 2008 is expected.

1.2.3 Poverty measured by Non-economic aspects

This section looks into non-economic aspects of poverty in Mozambique, particularly the Human Development Index (HDI), life expectancy at birth, education, health and gender.

The section is based on data collected by: “Understanding Poverty and Well-being in Mozambique” and INE and other international organizations.

(1) Human Development Index (HDI)

¹¹ AFRODAD Factsheet <http://www.afrodad.org/downloads/publications/Mozambique%20Factsheet.pdf>

¹² Johanna Jansson and Carina Kiala (2009) Patterns of Chinese investment, aid and trade in Mozambique, Center for Chinese studies

According to the Human Development Index (HDI), the regular publication of the United Nations Development Program (UNDP), Mozambique is still ranked 165th out of 169 countries. This is in spite of some of recent improvements. It has been regarded as one of three countries to achieve rapid improvements in HDI since 1990 and its speed of the improvement is astonishing¹³. Table 1-5 shows the trend of HDI and composition index in 1970 to 2010 released on the web of UNDP.

Table1-5 Trend of HDI and composition index from 1970 to 2010 (five years intervals)¹⁴

	1970	1975	1980	1985	1990	1995	2000	2005	2010
HDI value	0.190	0.230	0.259	0.224	0.248	0.263	0.309	0.355	0.381
Education Index	0.154	0.212	0.292	0.278	0.272	0.292	0.362	0.445	0.460
Health Index	0.304	0.342	0.361	0.360	0.371	0.410	0.438	0.438	0.449
Income Index	0.146	0.167	0.165	0.112	0.150	0.152	0.186	0.229	0.268

Source: UNDP <http://hdr.undp.org/en/data/trends/>

The HDI consists of three categories, education, health and income and is calculated using a weighted average of the three components, life expectancy at birth, literacy level, enrollment rate and purchasing power per person. The HDI approach is defined as a process of enlarging people's choices and enhancing human capabilities and calculated from 0 to 1.

Table 1-5 shows all three components have been performing at a very low level. In particular, the income index is stagnant. It implies that the majority of people grow food (agricultural

¹³ World Bank (2008)"Mozambique Beating the Odds : Sustainable Inclusion in a Growing Economy"

¹⁴ In order to grasp the most developed country, progress of HDI of 1970-2010 is characterized by Human Development Report (2010) using the original HDI index. For this reason, the numerical value of HDI differs from what was released in the past.

products) for their own consumption and basically lives off the land. Small-scale farming dominates the rural area. In addition, there are no industries in the rural areas to absorb a labor force. Therefore, most of workers who are excluded by regular or formal employment are forced to engage in agricultural work and live on their land.

The HDI marked its highest figure in the 1990s but the speed of improvement has been slow. Although life expectancy at birth has improved relatively speaking (more explanation on this later), the HIV/AIDS infection rate has worsened. Maternal mortality rate is 1 percent (1 000 out of 100 000 cases). The child mortality rate is high at 21.9 percent (219 out of 1,000 cases). This phenomenon is obviously prevalent in the rural areas.

On the other hand, the education sector shows great improvement. This is the outcome of strong commitment and assistance by the government and donor organizations. The enrolment rate of primary education has improved over time from 61.3 percent to 74.2 percent. The literacy level has also been improved. However, the quality of education is still problematic. It is a priority of government to improve the quality of lecturers, teachers and the general school environment.

(2) Education

The Table 1-6 indicates the improvement of the enrollment rate in basic education by comparing the result of 2002/03 and 2008/09. The south urban region - including Maputo city - has an enrolment rate of 91.1 percent. The south rural region has an enrolment rate of 85.9 in primary education. North and Central areas, which suffer from higher poverty, has an enrolment rate of 60 percent. There are a few regional disparities.

Table1-6 Enrollment rate (ER) in basic and secondary education by regions

Region	2002/2003		2008/2009	
	ER in primary education	ER in secondary education	ER in primary education	ER in secondary education
North urban	63.9	12.5	73.7	33.3
North rural	52.2	0.2	67.5	6.4
Central urban	82.9	18.6	82.2	39.9
Central rural	61.3	0.8	74.2	11.1
South urban	89.8	24.8	91.1	47.4
South rural	77.8	3.4	85.9	17.2
National average	66.8	8.2	76.5	22

Source: MPD (2010) "Understanding Poverty and Well-being in Mozambique: Third National Poverty Assessment"

This improvement is attributed to free education in the primary education and the efforts made to improve education by the Mozambique government. The National Education Policy in 1995 and the implementation strategy set three targets and one of them was “to improve accessibility to education”¹⁵. Moreover, the Education Sector Strategy (1999-2003) aimed at accelerating universal primary education, especially improving on the female enrolment rate¹⁶.

As an outcome of those policies, school construction and teacher training programmes have been promoted. Table 1-7 shows the trend in the number of primary schools, teachers and students. 605 schools have been constructed and 6 544 teachers have undergone training.

Table1- 7 Number of schools, teachers and students (2008-2009)

	2008	2009
Number of schools (1st level)	9,649	10 027
Number of students	4 109 298	4 233 454
Number of teachers	56 609	61 242
Number of schools (2 nd level)	2 210	2 437
Number of students	704 506	752 884
Number of teachers	17 281	19 192

Source: Ministry of Education and Culture, Directorate of Planning

Notes: 1st level refers to G1-G5, and a fifth grader deserves from the Japanese first grader in an elementary school and 2nd level points out G6 and G7, and the Japanese sixth grader in an elementary school and the first-year student in a junior high school deserve it.

However, as mentioned by the Director of Ministry Education and Culture, the “quality of education” has been a challenge in Mozambique. It raised concerns about under-trained teachers and high teacher-student ratio (66 students per teacher) - which is beyond the Ministry’s target for 2015 (55 students per teacher). The low quality of education is an urgent task for the Ministry to tackle¹⁷. A lower enrolment rate in secondary education is another concern for the Ministry. There are some improvements by comparison to the results of a 2002 survey. However, more than 50 percent of students in the south urban area are not enrolled for secondary education - and only 6.4 percent of students go to school in the north urban areas. The background behind this gap in enrolment rate with basic education is that tuition fees are payable and accessibility to secondary schools is problematic due to poor or lacking facilities. The government understands the situation and is considering introducing government subsidies for secondary education¹⁸.

¹⁵ Other two are "the maintenance and improvement in the educational quality", and "the organization for an education policy and establishment of financial bedrock"

¹⁶ Ministry of Foreign Affairs (2008) "ODA Evaluation in Mozambique"

¹⁷ It is based on local hearing investigation (educational culture prefecture)

¹⁸ It is based on local hearing investigation (educational culture prefecture)

(3) Health

The share of households with less than a 45 minute walk to the nearest primary health facility has been improved in the last five years: the share in 2008/09 in the north rural area: 69.7 percent of households are able to access to the nearest facility within a 45 minutes walk compared to 31.5 percent in 2002/03.

Access in the center rural and south rural areas has also improved. However, the access in urban areas to primary health facilities has worsened. This implies that households living in urban areas prefer to go to hospital and other medical facilities rather than a primary health facility and thus the demand for primary health is reducing in urban areas.¹⁹.

Table1-8 Share of households with less than 45 minutes walk to the nearest primary health facility

	20002/2003	2008/2009
North urban	86.3	75.4
North rural	31.5	69.7
Central urban	88.8	76.3
Central rural	35.0	47.6
South urban	92.0	78.7
South rural	48.8	53.6

Source: MPD (2010) "Understanding Poverty and Well-being Mozambique: Third National Poverty Assessment"

The share of households with access to safe water shows regional disparities. Only the south urban region appears to be improving (55.6% in 2002 to 77.5% in 2008). Despite small improvements in seven provinces in the North and Central region, only one-third of the population is able to access safe water. The central region, especially in its rural areas, appears to be increasingly disadvantaged as compared to the rest of the country.

Table1- 9 Share of Households with access to safe water

Regions	20002/2003	2008/2009
North urban	55.0	49.1
North rural	25.7	32.3
Central urban	62.7	76.3
Central rural	21.7	27.1
South urban	56.6	77.5
South rural	38.6	36.3

Source: MPD (2010) "Understanding Poverty and Well-being Mozambique: Third National Poverty Assessment"

¹⁹ MPD (2010)"Understanding Poverty and Well-being Mozambique: Third National Poverty Assessment" P16

In spite of various measures and commitment by the government and donor organizations, the number of HIV/AIDS patients is increasing. The infection rate remained at 14 percent over the last three years but the number of patients grew to 1.7 million (by 100 000) in 2010 due to steady population growth in Mozambique. There are 360 adults and 85 children newly infected by HIV/AIDS every day in Mozambique. The four provinces in the central region have the worse statistics: 630 000 people have passed away due to HIV/AIDS between 1998 to 2009. By contrast, the Northern provinces had 120 000 deaths and the southern provinces had 200 000 deaths. There is a regional disparity between north and other areas²⁰. The reason behind the regional disparities where the HIV/AIDS infection rate is higher in the north and the central areas is due to a lack of health facilities. The lack of health facilities causes lower accessibility of free ARVs in both areas. In addition, the Ministry of Health in Mozambique attributes the cause of the severe situation to poor education of human sexuality at schools. Thus, both the Ministry of Health and Ministry of Education and Culture have implemented a joint project to introduce education for human security at school.²¹.

²⁰ MPD (2010) "Understanding Poverty and Well-being Mozambique: Third National Poverty Assessment" P94

²¹ Based on interviews with Ministry of Health

New infected person day (adult)	355	355	360
New infected person day (child)	85	85	85

Source: INE <http://www.ine.gov.mz/hiv/ipcthivmz>

(3) Life expectancy at birth

Life expectancy at birth appears to have improved. It is now 51.6 years, which is an improvement of 7 years since 2000. Both government's proactive strategy and the assistance of donors in the health sector contributed to this improvement. In particular, European donors made huge contributions in the health sector. Free distribution of ARV has helped to improve life expectancy.

Table 1-11 Life expectancy at birth (2000-2009) (unit: age)

	2000	2001	2002	2003	2004	2005	2006	2007	2009
Life expectancy at birth	44.30	45.00	45.60	46.30	46.70	47.10	47.40	50.76	51.62

Source: INE

(4) Gender

Gender related index refers to the Gender Inequality Index (GII) of UNDP. The GII analyses the following as three influential factors to gender equality and derives the GII index, health (reproductive health), empowerment, and labor market participation. The figure is from 0 to 1 and 0 means the most equal. Mozambique is currently 0.718 and ranks at 111th out of 138 countries. Table 1-12 shows the results components of GII.

Table1-12 Components of GII

Health (reproductive health)	The rate of a seat of the woman in Parliament (%)	35
	Percentage of the women who receive high education (%)	2
Empowerment	The death toll per 100,000 pregnant women and nursing mothers	520
	Adolescence birthrate (1000 student child birth)	149
Labor market participation	A female labor-force participation rate (%)	87

II. Poverty reduction strategy

2.1 National Poverty Reduction Strategy

The Ministry of Planning and Development (MPD) is in charge of comprehensive poverty reduction and poverty monitoring issues in Mozambique. In April 2010, the Parliament approved the National Development Plan (2010-2014) called “the Five Years Plan (2010-2014)”, which leads all poverty reduction strategies in Mozambique. It takes up the poverty programme as one of the most important issues and sets absolute poverty reduction as a priority through improving education and health and agricultural development. In addition, the PARPA is an action plan to achieve the targets of the Five Year Plan. The PARPA I was implemented between 2001 and 2005 and the successive strategy, the PARPA II (2006-2009) was completed in 2010. Currently, Mozambique government is preparing the PARP (Action Plan for Reducing Poverty) as a successive action plan of the PARPA II²². The bottom-up approach has been adopted to prepare poverty strategies. It means that civil society, which suffers from poverty, forms the Poverty Observatory and makes various inputs and suggestions based on their experience on the ground through the process of identifying poverty strategies. Government and donor organizations have cooperated to make policies based on inputs from civil society. As decentralization accelerates in Mozambique, the provincial and rural viewpoints on poverty are important inputs for them²³.

According to interviews conducted in Mozambique, the PARP has two priority areas, improving agricultural productivity and boosting employment. Although agriculture is one of the main industries to absorb approximately 80 percent of the workforce in Mozambique, the industry faces a variety of problems, such as, slow infrastructure development, low modernization, and rain-fed cultivation. These issues have constrained development in rural areas. On the other hand, the urban problem is varied. Unemployment is a major cause of poverty in urban areas, especially bigger cities like Maputo. The unofficial unemployment rate in Maputo city is close to 40 percent and it has been said that urban people are frustrated with the government, which has failed to improve the situation. The riots that took place in September are symptomatic of the frustration of the people, triggered by the announcement of price increases that month. The movement spread from Maputo city to the rest of country²⁴.

²² The concept of absolute poverty will be excluded in PARP.

²³ http://www.entwicklung.at/uploads/media/Country_Strategy_Mozambique_2010-2013_04.pdf

²⁴ By having expressed the price increase of the bread by the government, electricity, and the price for water service in September, 2010, civic dissatisfaction exploded and it became a riot. Mozambique depended for wheat on import and the import price rise of wheat had the price increase of a pan price.
<http://www.wsws.org/articles/2010/sep2010/moza-s04.shtml>

2.2 Policies in each sector

2.2.1 Agricultural Sector

The Ministry of Agriculture has been handling the agricultural development policy in Mozambique. Currently, the Ministry is preparing a new development strategy: the Strategic Plan for Agricultural Development” (PEDSA) (2010-2014). The PEDSA will be incorporated into “the Five Years Plan (2010-2014)” and aims to achieve five key objectives, (1) to improve agricultural productivity and competitiveness, (2) to develop infrastructure and agricultural service, (3) sustainable usage of natural resources (land, water, and forest), (4) to develop registration to encourage investment and (5) to enhance agriculture-related organizations. As explained earlier, agricultural productivity is heavily dependent on rain and small farmers are dominant in Mozambique. The direction of PEDSA (2010-2014) will promote modernization of agriculture and will target an annual growth rate of 7 percent in agricultural productivity.

There are other programmers such as, PAPA (Food Production Action Plan) which emphasizes agricultural productivity and ESAN (Food and Nutritional Security Strategy) II which focuses on security issues.

There is another important strategy: the PROAGRI (National Agricultural Development Program). The objective is to promote by both the government and donor organizations. PROAGRI I (1994-2004) emphasized the importance of organizational capacity development and implemented capacity building projects to agricultural administrative staffs of both central and local governments. PROAGRI II (2007-2010) had three activities, (1) to activate agricultural productivity, (2) to implement projects proposed by local governments and (3) to develop agricultural guideline.

2.2.2 Health Sector

The Ministry of Health is in charge of the development strategy in the health sector. PESS (Health Sector Strategic Plan) (2007-2012) was developed and implemented as a sector development strategy to achieve the targets of MDGs and the Five Year Plan, health education, improvement in nutrient situation, environmental improvement, improvement in safe water access and improvement of regional disparity have been priority areas.

Both government and donor organizations understand that the lack of health facilities and health workers are the two main problems in Mozambique. There are only four Training Schools for Health Personnel²⁵ in capital cities of four provinces: Maputo, Beira, Nampula and

²⁵ In addition, construction of a medical worker school is planned by South Korean loan support in the northern Zambezia province where population is large.

²⁵ Local hearing (Department of Health)

Quilimane²⁶. According to the Ministry, it is obvious there is a need to improve both the quality and quantity of health care facilities. Nine small scale health training institutions, called the Training Center for Health Personnel, play important roles to produce skilled health workers. In addition, the government and donors intend to provide overseas training opportunities to professional health workers to gain more knowledge and provide accommodation for health workers posted in rural areas. In the health sector in Mozambique, decentralization is in progress. The Ministry of Health is primarily responsible for a policy-making function and the local governments in each province are in charge of implementing healthcare programmes.

Rapid expansion of HIV/AIDS is an urgent and ongoing challenge for the government of Mozambique. Main countermeasures are the prevention from infection and free distribution of ARVs. The Ministry emphasizes the importance of peer education and prevention, and promotes medical education and popularization of medicine in rural areas.

The medical expenses are free of charge. The government allocates a budget to HIV/AIDS medical expense. This is attributed to the vestiges of the socialist policy in 1970s. However, the source of budget has been dependent on budget support and the health sector common funds. In 2010, the delay in disbursement to budget support and common funds created confusion among patient when the government failed to cover the medical expenses.

2.2.3 Educational Sector

The Ministry of Education and Culture is in charge of developing sector strategy and currently implements the ESSP (Education Sector Strategic Plan) (2006-2010/11), which aligns with the Five Years Plan. The ESSP (2012-2016) is in the development phase and will be open to the public in July 2011. The current ESSP emphasizes the importance of increasing accessibility to primary education, improving quality of education and enhancing organizational capacity to implement education policies. The ESSP (2012-2016) will include the provision of pre-primary education and vocational training as addition pillars of the strategy. The Ministry has not set any regional priority areas but is paying attention to equal development through the country.

The Ministry will manage the progress of primary education by the National Education Policy and Strategy for implementation (1995-1999), the ESSP (1999-2003) and the ESSP (2004-2006). The Ministry has targeted secondary education and higher education as priority areas. The people of Mozambique and politicians demand that the Ministry tackle problems facing secondary education.

²⁶ The training school in Quilimane was constructed by Japanese assistance.

2.2.4 Rural Development and Economic Promotion

Rural development is the term used as a synonym for agricultural development in Mozambique. PARPA II includes rural development and economic promotion as the area of priority. It has targeted the following objectives, improve agricultural development through enhancing sector and regional collaborations and expand the market by developing international and local flows of goods. The government promotes the development of transportation infrastructure, distribution system, and trade institution to activate the exchange of people, goods, and information. In addition, “development of competitive private sector” and “enhancing internal investment by developing financial system” has been set as the main targets in economic promotion. The development of the Beira corridor in central region and the Nacara corridor in north region will lead to inflows of foreign direct investment, which will encourage infrastructure development in both regions²⁷.

2.2.5 Infrastructure Development Sector

During the Civil War that erupted in 1977, railroad, road, schools and health facilities were targets of attack and destruction by antigovernment groups. The destroyed infrastructure has restricted economic activities in rural areas and is one of the causes of poverty in Mozambique. When the Civil War ended in 1992, the government and donor organizations collaborated to develop infrastructure. The PARPA I was launched in 2001. It focused on basic infrastructure development. The PARPA II, which shifts its purpose to economic development, continues with infrastructure development. Agriculture development encompasses the development of irrigation systems, water supply facilities, plumping facilities and transportation systems.

The ICT infrastructure development has recently made progress. Undersea cables - called Seacom and EASSY – are linked to Maputo city and Mozambique is now linked to South Africa and Kenya.

The above infrastructure development has relied on financial support by donors as well as Mozambique’s own resources. African Development Bank (AfDB) and Millennium Challenge Corporation (MCC) have focused on infrastructure development as their key strategy in Mozambique.

Table2-1 Infrastructure support for Mozambique (unit: million dollars)

²⁷ Ministry of Foreign Affairs (2008) "evaluation according to Mozambique"

2.2.6 Water Supply Sector

The Civil War destroyed water supply facilities and land mines restricted accessibility to water facilities. The PARPA I objective was to improve water accessibility to 46 percent by 2005, which 40 percent in rural areas and 50 percent in urban areas. However, the PARPA I only achieved an access rate of 41 percent and failed to achieve its target. It was estimated in 2008 that 48.5 percent of people would have access to safe water²⁸. There are provincial disparities. The worst figure is 31 percent access in Nampula province. Maputo province has the highest rate at 70 percent. It is a big challenge for the government to achieve the MDG goal. The PARPA II sets a national target, which is for 70 percent of people access to safe water in 2015. The Sector Development Strategy, the PESA (Rural Water Supply and Sanitation) was created and set a target of 55 percent access to safe water by 2009²⁹. Main donors in the water sector are AfDB, UNICEF, and MCC.

III. Poverty Analysis

3.1 Analysis by Income Poverty

3.1.1 Analysis of income poverty

The definition of poverty in Mozambique has changed in the past ten years. The official definition of poverty was defined in the first poverty assessment as "Understanding Poverty

²⁸ Coberturas do Abastecimento de Agua Rural 2000 A 2008, DNA

²⁹ Ministry of Foreign Affairs (2008) "ODA evaluation in Mozambique"

and Wellbeing in Mozambique". It was later adopted by PARPA I (2001-2005) as “The inability of individuals to ensure for themselves and their dependents a set of basic minimum conditions for their livelihoods and well-beings, according to the norms of society”. Under the PARPA II, the definition was expanded and postulated that it is “the impossibility of incapacity or lack of opportunity for individuals, families and communities to have access to minimum conditions”

As explained earlier, the MPD publishes the poverty report, titled "Understanding Poverty and Well-being in Mozambique". In these reports, the poverty line is different to internationally accepted criteria, which is a person living on less than 1.25 US dollars per day. The international poverty line - mainly calculated by consumption - is used for analysis. The methodology employed to measure poverty in Mozambique follows the Cost of Basic Needs (CBN) approach. The national poverty line in Mozambique consists of two components: food consumption and non-food consumption. The sum of these two components is set as the national poverty line (Please refer to Table 3-1). In the second assessment of poverty situation in 2004, 60 percent of the food poverty line was set as ultra-poverty line. There was no explanation in the third assessment published in 2010.

Table 3-1 Overview of poverty line

Source: MURC creation based on the second and third assessment of Understanding Poverty and Well-being in Mozambique

The food poverty line is obtained by minimum calories per person per day based on the results of a household survey. The updated "Understanding Poverty and Wellbeing in Mozambique" defined minimum calories as 2 144 kcal. It also takes into consideration geographic differences in costs of living³⁰. Mozambique is then divided into 13 relatively homogeneous spatial domains³¹. The food poverty line is simply the cost of the bundle of food

³⁰ MPD (2010) "Understanding Poverty and Well-being in Mozambique" P82

³¹ There are 13 domains, such as rural area in Niassa and Cabo Delgado provinces, urban areas in Niassa and Cabo Delgado provinces, rural areas in Nampula province, urban areas in Nampula province, urban areas in Sofala and

products. It is difficult to define a reasonable bundle of non-food items consumed by the poor. An indirect methodology is applied to calculate non-food consumptions. Poor people allocate a considerable share of their total consumption to non-food items. Thus average non-food consumption is calculated for households whose total per capita consumption is close to the food poverty. This expenditure is viewed as a minimum budgetary allocation required meeting basic non-food needs and is defined as the non-food poverty line. The total poverty line is then obtained as the sum of the food poverty line and the non-food poverty line³².

Table 3-2 summarizes the result of the food and non-food poverty line by 13 geographical domains. For comparison purposes, the result of 2002/03 survey is also shown. The national poverty line is 18.4Mt (equivalent to 0.5 USD). The food poverty line is 13.6 Mt (0.38USD) which represents a share of 75 percent of the national poverty line. The situation has not changed much. With regards to regional differences, it is more expensive in the urban areas to obtain 2 144 kcal per day than in rural areas. It costs 20.9Mt (0.6USD) in Maputo city to obtain the defined minimum calories. On the other hand, it costs only 14.1Mt (0.4USD) in the rural areas.

Table3-2 The poverty line according to area (unit: metical (Mt))

	Poverty lines 2002/03			Poverty lines 2008/09			Food shares		Ratio of lines 08/02

Notes: 1 dollar = 35Mt (exchange rate in January 2011)

3.1.2 National and Provincial poverty situation

The MPD is conducting an analysis of poverty based on the household surveys that are

Zambezia provinces, rural areas of Sofara and Zambezia provinces, urban areas of Manica and Tete provinces, rural areas of Manica and Tete provinces, urban areas of Gaza and Inhanbane provinces, rural areas of Gaza and Inhanbane provinces, urban areas of Maputo province and rural area of Maputo province, and Maputo city.

³² MPD (2010) "Understanding Poverty and Well-being in Mozambique

carried out by INE every five years. The sample sizes were 8 250 in the 1996/97 survey, 8 700 in the 2002/03 survey and 10 832 in the 2008/09 survey. Although some people in Mozambique pointed out political interventions in the sample methodology, the report "Understanding Poverty and Wellbeing in Mozambique" analyzed over the three survey periods, the poverty rate, the poverty gap and the squared poverty gap by provinces and by regions. It enables us to comprehend and analyze the poverty situation since 1996.

(1) Poverty rate

The report "Understanding Poverty and Wellbeing in Mozambique" provides a poverty rate by region, provinces, and areas since 1996. It helps to understand national and regional trends in the poverty rate. Table 3-3 shows the results of last three poverty assessments by provinces, regions and areas. In order to understand the progress, the first and the second assessments and the comparison is included in Table 3-3. The national poverty rate was dropped by 0.6 points. The rural areas worsened by 1.6 points. The central area improved by 14.3 points. Zambezia province is the worst province: 70.5 percent – improved by 25.9 points. Maputo province is in second worst position: 67.4 percent - improved by 1.9 points. Gaza province is third worst position: 62.5 percent - improved 2.4 points. Sofala province is in fourth position: 58% - which improved by 21.9 percent.

On the other hand, comparisons between 1996/07 and 2008/09 present a different trend. Nationally, the poverty rate was improved by 14.7 points. Both urban and rural areas improved - except for Zambezia province and Maputo province. Other provinces showed an improvement in their poverty rate.

Table3-3 Transition of a poverty rate

	Poverty rate (%)			Comparison (point)

Source: MURC created it based on the Poverty and Wellbeing in Mozambique

Note: Minus shows an improvement of a poverty rate

It is not easy to understand the causes and background of those changes in the poverty rate. However, there is some suspicion surrounding drastic improvements in the second assessment. This led to some donor organizations commenting on artificial control of data collection and counting. However, it is clear that the poverty rate has shown a tendency to improve since 1996.

Improvement is more obvious in rural areas rather than urban areas. Provincially, provinces which are less dependent on agriculture, such as the Tete province and Inhambane province experienced a huge improvement. The Tete province has an active coal mining industry. The Inhambane province has a strong inflow of investment in its tourism industry. However, provinces that are highly dependent on agriculture - such as the Zambezia and Gaza provinces - did not show improvement in the poverty rate. Unfavourable weather in 2008 negatively affected the Zambezia province.

(2) Poverty gap

The poverty gap is the mean shortfall of the total population from the poverty line (counting

the non-poor as having zero shortfall), expressed as a percentage of the poverty line. This measure reflects the depth of poverty as well as its incidence³³.

Table 3-4 shows the result of the poverty gap for last three assessments:

- the 2002/03 assessment showed progress from 29.3 to 20.5 but worsened to 21.2 in 2008/09
- the central region was downgraded by 8.3 points
- Zambezia, Manica and Sofala provinces made negative progress
- the Gaza province and Maputo province made good progress

The results show that there are still many people suffering from poverty.

As explained in the poverty rate, it is a common phenomenon that the predominant industry is agriculture in the high poverty gap provinces. The agriculture industry has not been industrialized. Productivity is dependent on natural conditions, such as rainfall³⁴. This creates an unstable economic situation and prevents poverty reduction. On the other hand, the growth of coal mining industry in Tete province is contributing to poverty reduction.

Table3-4 Poverty Gap Trends

	Poverty gap			Comparison (point)		
	1996/97	2002/03	2008/09	Gap between 96/97 and 02/03	Gap between 02/03 and 08/09	Gap between 96/97 and 08/09

³³ <http://unstats.un.org/unsd/mdg/Metadata.aspx?IndicatorId=0&SeriesId=584>

³⁴ It analyzes by 3.3.2 vulnerability analysis for details.

(3) Squared poverty gap

The squared poverty gap is described as a measure of the severity of poverty. While the poverty gap takes into account the distance separating the poor from the poverty line, the squared poverty gap takes the square of that distance into account. It gives more weight to the very poor³⁵. The squared poverty gap shows a trend similar to the poverty gap. There was a huge improvement in the 2002/03 assessment by 5.3 points but the situation worsened by 0.7 points in 2008/09. However, the comparison between the results in 1996/07 to 2008/09 proves that all provinces except Zambizia and Sofala provinces, made progress by 2 to 15 points. The southern provinces - other than Maputo city – recorded a higher gap. The Zambizia and Manica provinces were also high.

The trend of the squared poverty gap is similar to the poverty gap. However, the Sofala province had the worst squared poverty gap while the Gaza province had the worst poverty gap.

Table3-5 Trend of Square poverty gap

	Poverty gap			Comparison (point)

3.2 Unequal Index and its trend

³⁵ http://siteresources.worldbank.org/INTPA/Resources/tn_measuring_poverty_over_time.pdf

3.2.1 Gini coefficient

The national poverty rate made some improvement. However, the inequality index shows a small downgrade. The Gini coefficient in urban areas worsened from 0.481 to 0.47. Maputo city is the most unequal society - its figure is 0.512. The Gini coefficient in rural areas is 0.445. The Cabo Delgado province was the second worst province after Maputo city in 2002/03 assessment - it improved to 0.347. The rural areas made progress from 0.37 in 2002/03 to 0.367 in 2008/09.

The results were aligned with the analysis of previous chapters.

3.3 Poverty analysis by other methodology other than Income Poverty

3.3.1 Designated areas/groups by the Government

The Government of Mozambique has not set any designated areas for special treatment for the reduction of poverty. The PARPA I and II was not focused on any specific areas or people. The strategy currently under development - the PARP - will follow a similar philosophy and will not set any priority areas.

On the other hand, it has been pointed out by some specialists in Japan and Mozambique that the FRELIMO administration has unofficially prioritized investment or poverty reduction support areas. The ruling party, FRELIMO, has been paying special attention to those provinces of opposition party, RENAMO. It means that FRELIMO is using development policies to cut into RENAMO's political foundation. This strategy seems to have been successful. FRELIMO managed to establish superiority in those provinces formerly dominated by RENAMO - such as the Manica and Zambezia provinces in the central region. It resulted in a land-slide victory of FRELIMO in the 2009 general election. FRELIMO took power in local administrations other than Beira city.

Table3-7 The result of the general election in Mozambique (1994, 2004, 2009) (unit: %)

Beira city in the Sofala province is the only city which put a non-FRELIMO mayor in position in the last general election held in 2009³⁶. It is said that the FRELIMO government takes unfavorable actions and interventions in poverty measures in Beira city. The result of the poverty rate in 2010 is attributed to this intervention.

3.3.2 Vulnerability Analysis

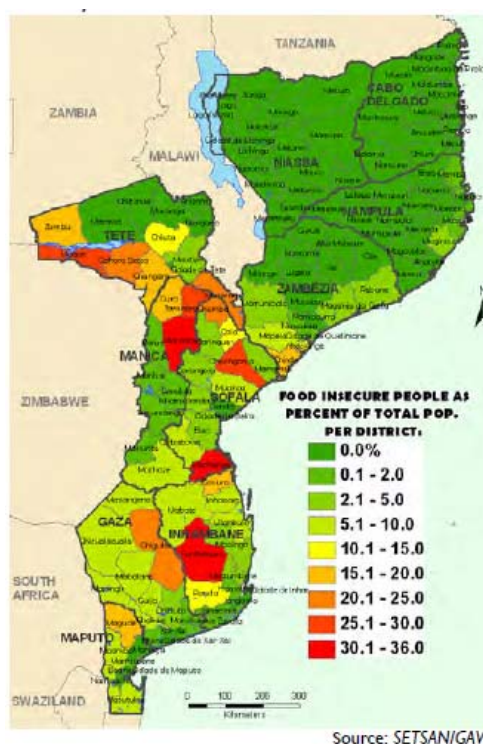

Vulnerability is defined as the exposure and sensitivity of persons or households to the risk of hunger and livelihood shocks or a risk of deteriorating food insecurity - no matter what the level of poverty of household. The risk is a combination of the probability or frequency of

³⁶ Mr. David Simango of the mayor is a former RENAMO member of the party. It is RENAMO party membership from 2004 to 2009, and he is the Beira mayor. In the general election in 2009, new political party and MDM were founded, and the Beira mayor was reelected.

occurrence of a defined hazard and the magnitude of the consequences³⁷. It has been thought that food insecurity, natural disasters (which affect agricultural productivity), and a deteriorating health situation, including HIV/AIDS and poor nutrition are factors that influence vulnerability in Mozambique.

In addition, Mozambique faces natural disasters, drought and flood every two to three years. Both drought and floods negatively impact on agricultural productivity. Once there is a slump in agricultural production, the balance of demand and supply is lost – and the price of food increases. The increase in the price of food negatively impacts on living in poverty and results in vulnerability.

Table3-9 Food insecurity in Mozambique

Losses in the labor force due to chronic diseases, such as HIV/AIDS, will increasingly be a factor that will increase vulnerability. According to the “*Comprehensive Food Security and Vulnerability Analysis*” of WFP, about two-thirds of deaths are male - who are the main breadwinners for households. Sofala, Maputo and Cabo Delgado provinces are particularly vulnerable to this scenario³⁸. The loss of the main income source degrades living standards. It creates additional problems, such as lowering agricultural productivity and failure to send

³⁷ JICA (2010) “Kingdom of Cambodia, Study for Poverty Profile in the Asian Region”

³⁸ The rate of HIV of 15 to 49 years old is as high as 16%

children to school. Thus, it causes a ripple effect which results in increased vulnerability.

A Comprehensive Food Security and Vulnerability Analysis found the Coping Strategy Indicator (CSI) in Mozambique is 25 (27.5 for rural areas and 24 for urban areas)³⁹. The CSI was 40 in a similar study conducted by WFP in 2008. Thus, the CSI has improved. Neighboring countries Lesotho and Zambia were over 60. Zimbabwe and Malawi were 40 in the 2008 study⁴⁰.

3.4 Factor Affecting Poverty

3.4.1 Domestic Factors

(1) Factors in agricultural (rural) areas

The factors impacting poverty are varied in urban and rural areas. As repeated many times, the main industry in rural areas is agriculture but it is less modernized and productivity is highly weather-dependent. The economic situation is over-dependent on unstable conditions and agricultural incomes are the main cause of poverty.

The population of rural areas grew to 15 million in 2008. It is expected that most of them engage in agriculture. As the population grew, the number of smaller-scale farmers increased to 3.7 million in 2008 - representing 20 percent in six years. On the other hand, agricultural modernization was slow, if any, to improve. Use of chemical fertilizers and pesticides remains very low at 4.1% and 3.8% respectively. Receipt of extension information, irrigation systems and credit are also low: 8.3%, 8.8% and 2.6% respectively. One of the serious problems is that there is little to no improvements made in agricultural modernization. This is despite the fact that a sector development strategy was implemented in 2002. Despite budget constraints and poor management capacity of the implementers, further efforts are necessary to improve this situation.

³⁹ CSI(s) are restriction of the number of times of a meal, restriction of an intake, borrowing of food and casual labor. It means the stress to a household economy where access to food is so low and the numerical value is low.

⁴⁰ WFP (2008) The Coping Strategies Index-A tool for rapid measurement of household food security and the impact of food aid programmes in humanitarian emergencies

Table3-10 Trend in agricultural-related indicators

	2002	2003	2005	2006	2007	2008	Difference of 2002-08 (%)

Source: MPD (2010)"Understanding Poverty and Well-being Mozambique: Third National Poverty Assessment"

(2) Factors in urban areas

The factors in urban areas are different to those in rural areas. Employment (unemployment) is the main factor affecting poverty in urban areas. The unofficial unemployment rate in Maputo city is 40 percent⁴¹. It is 36 percent in Beira city, which is the third largest city in Mozambique⁴².

There are various reasons for the higher unemployment rate in urban areas. Privatization since 2000 encouraged lay-offs. Not all refugees from the Civil War have returned their hometowns but rather have moved into the urban areas⁴³. The agriculture industry in urban areas fails to absorb surplus labor due to the scale of non-arable land. In addition, unlike Asian development, there is limited industry in Mozambique which is labor intensive and it is not an area which is showing any growth⁴⁴.

These factors have caused higher unemployment rate in urban areas⁴⁵. Thus, the frustration with ineffective government and its policies has been building up. Large-scale riots occurred in September 2010 which was triggered when the government announced an increase in the price of bread and petrol. The background of higher unemployment rate in urban area is a mismatch in the labor market. In spite of higher economic development due to large investment inflows into mining, agricultural and service sectors, higher unemployment rate has been a key

⁴⁴ Katsumi Hirano (2009)

⁴⁵ About an unemployment rate, the column of employment explains details below.

challenge. It implies that the supply side fails to provide much needed human resources to the labor market. For example, demands for engineers in the mining sector and accountants in the financial service sector are high. However, there are limited numbers of qualified workforce in Mozambique⁴⁶.

The government fully understands the need for a marketable workforce and has been putting efforts into training and upskilling professionals. The government implemented the Employment and Profession Training Strategy, which trained 170 000 people (120 000 males and 50 000 females) in 5 years up to end 2009. The strategy plans to create one million employment opportunities by 2015. However, the lack of investment in job creation and capacity building to meet market criteria becomes a constraint to growth and progress⁴⁷. New strategy currently being developed - the PARP - focuses on job creation as a pillar of poverty strategy. Continuous efforts are necessary to tackle the problem.

(3) Budget is dependent on donor assistance

As mentioned, Mozambique is currently implementing the Fourth National Development Plan (2010-2014). The PARPA is also regarded as an action plan to achieve the goals of the Development Plan. The PARPA II (2006-2010) had eight cross-cutting targets, gender, HIV/AIDS, environment, food and nutritious security, science technology, agricultural development, natural disaster and de-mining. The PARP is currently under development and seems to focus on two main issues, agricultural productivity development and improvement in urban employment.

The government tackled poverty by allocating budget to education, health - including HIV/AIDS - infrastructure development and agricultural development. Table 3-13 explains the budget allocation since 2006 to 2010. The budget for education was the largest allocation at 21.2 percent of total budge. The health budget comprised 18-19 percent of the total budget. The share for agriculture was 7 percent. It should be noted that this allocation is a shift away from the usual trend which is the result of PARP being implemented.

⁴⁶ The number of the engineers per 1 million in 2002 is overwhelmingly insufficient of engineers with two persons.

⁴⁷ Republic of Mozambique "Report on the Millennium Development Goals" (2010)

Table3-11 Sectoral budget allocation (2006-2010)

Source: P ARPA II

It is a challenge for Mozambique that its national budget is heavily dependent on general budget support and a sector wide approach (SWAPs). Table 3-14 shows that expenditure is almost double that of income and chronic deficits have been filled by donor assistance. Most of donor assistance tends to be used for implementation of projects and programmes. Any delay or halt in disbursement will affect the progress of poverty reduction strategies. In fact, the disbursement in 2010 was delayed due to the global financial crisis and it caused chaos on the ground.

The government intends to improve the situation. The chaos that happened in 2010 has encouraged the government to be less dependent on the budget. The establishment of a sound tax collection system is necessary to achieve this goal.

Table3-12 Source of budget (1 million MT, %)

	2005	2006	2007	2008	2009	% of GDP

(4) Governance

The Global Governance Indicator of World Bank analyses the governance situation in Mozambique. It helps us to understand the changes since 2004 to present. The composite

measures of governance generated by the Unobserved Components Model (UCM) are in units of a standard normal distribution, with mean zero, standard deviation of one, and running from approximately -2.5 to 2.5, with higher values corresponding to better governance. The percentage ranking ranges from 0 (lowest) to 100 (highest)⁴⁸. The World Bank publishes the report every year from 2004.

Table3-13 Global Governance Indicators (2004-2009)

Source: World Bank <http://info.worldbank.org/governance/wgi/index.asp>

Except for “Political Stability and Absence of Violence”, the other five indicators are negative and there has been no progress since 2004. The political stability by the FRELIMO government contributes a relatively higher score for “Political Stability and Absence of Violence”. It was ranked 63.67 in 2009. Regarding “Voice and Accountability”, there is an authoritarian management of policies by the FRELIMO government but there is some presence of civil society such as G20. Thus, the ranking was 46.91 in 2009. Ranking on “Rule of Law” and the “Control of Corruption” remains low.

There have been some progresses in decentralization in Mozambique with the collaboration of donors. However, the administrative system and organization is highly centralized⁴⁹. There is no local parliament and the central government controls policies and programmes. It is impossible for the central government at Maputo to effectively control everything happening in

⁴⁸ For further reference, please see <http://info.worldbank.org/governance/wgi/resources.htm>

⁴⁹ As an example of donor support aiming at promotion of decentralization, the "National Decentralization Planning and Finance Programme was implemented by the World Bank and other donors.

Mozambique with a vast geographical territory. Acceleration of decentralization is necessary to implement effective development programmes.

(5) Employment

The official unemployment figure for Mozambique is 18.7 percent of FTRAB. It is relatively lower than neighboring countries, like South Africa (30%)⁵⁰. However, only 13.3 percent of the total number of employers is engaged in the formal sector or are informal workers, such as self-employed workers. Family workers - made up of self-employed or contributing to the family - comprise 86.7 percent of total workers (62.1% and 24.6% respectively).

Table3-14 Employment status (unit %)

	2005	
	Whole	Only urban areas
Waged and salaried workers	13.3	36.2
Self-employed workers	62.1	52.3
Contributing family workers	24.6	11.5

Source: ILO (2009) National Profile of Working Conditions in Mozambique

Considering urban employment, the unofficial unemployment rates in Maputo and Birea cities was 40 percent and 36 percent, respectively. Only 36.2 percent of urban workers are engaged in the formal work and 63.8 percent are in the informal sector. It implies a dire situation faces urban citizens. Table 3-17 shows the types of occupation in urban areas. The 39.1 percent of total employees are skilled agricultural workers and fishery workers, which pays the lowest minimum salary. Higher paid jobs, namely “Senior officials, professionals and technicians” only make up 10.1 percent of the total formal employment.

Table3-15 Share of formal workers by type of occupations (unit %)

	2005
Senior officials, professionals, technicians, etc.	10.1
Clerks	3.1
Personal service and sales workers	23.5
Skilled agricultural workers and fishery workers	39.1
Craft and related trade workers	10.1
Unskilled workers, elementary occupations	11.3
Others	2.7

Source: ILO (2009) National Profile of Working Conditions in Mozambique

⁵⁰ Although the South Africa government is not announcing the unemployment rate in a broad sense - including the workers who gave up employment – an investigation by an international organization or a private research institute has revealed that the unemployment rate exceeds 40%.

Table3-16 Minimum wage by industries (Unit: Mt)

	Minimum wage
Agriculture, livestock, hunting and forestry	1 486 - 1 500
Fisheries	2 050
Mining	2 120
Manufacturing	2 300
Electricity, gas and water	2 403
Construction	2 215
Non financial services	2 250
Financial services	2 758

Source: ILO (2009) National Profile of Working Conditions in Mozambique

As explained in the “Factors in urban areas”, the challenges in the labor market are obvious. As with other African countries, the mismatch of demand and supply causes problems in the market. On the demand side, there is limited industry to absorb the labor force and this limited industry has not grown. The majority of the workforce are either self-employed or are family contributing workers. On the supply side, there are a limited number of qualified workers to meet the requirements of the formal sector. Thus, the number of workers who are agricultural workers or unskilled workers is growing and less formal work happens.

3.4.2 Poverty Reduction by Geopolitical Factor and Private Investment

Geographically and historically, Mozambique has a deep connection with its neighbor, South Africa. Both countries have a strong economic and social relationship now. Today, South Africa is the biggest trading and investment partner in Mozambique. South Africa issued 170 applications for investment between 2000 and 2004 - which amounted to 1.07 billion USD for Mozambique. This huge investment by South Africa has contributed to the current economic growth in Mozambique. South Africa represents a share of 28 percent of total investment business cases and 51.2 percent of total investment⁵¹. Among the investments made is the Mozart project. It was an investment made by BHP Billiton, Mitsubishi Corporation and Industrial Development Corporation of South Africa (IDC). In addition, investment in other sectors has boomed, such as in finance, retail, agriculture, leisure and restaurants.

Trade with South Africa is crucial to the Mozambique economy. The inflow of goods from South Africa – such as cloths, commodities and foods - are essential for people in Mozambique to sustain their life. This is obvious in Maputo city.

In addition to investment and trade, the mining sector and agriculture sector are the two main industries that South Africa has invested in and this offers employment opportunity to people

⁵¹ Katsumi Hirano "African deployment of the African South Africa company which a floatation changes, and the China company" (IDE)

in Mozambique. A lot of people migrated to South Africa as mining workers and take cash income back to the family in Mozambique. From 2005 to 2009, 220 000 people migrated to South Africa to work in the mining industry. At least 33 000 people migrated to work on commercial farms in South Africa⁵². In 2008, the remittance reached 110 million, which represents 1.2 percent of total GDP⁵³. This remittance is an important source of income for people living in poverty and their families⁵⁴. The Gaza province has been a main source of migrants to South Africa. The remittance has been regarded as one of two sources of cash income and is spent on the purchase of food, tuition fees and upgrading agricultural equipments⁵⁵. This cash income helps alleviating poverty in Mozambique. South Africa is a country with a high HIV rate. The negative impact of migrants to South Africa is rapid spread of HIV/AIDS⁵⁶. It is obvious that the South African influence through migrant activity in mining and agricultural, investments and trade contributes to create employment opportunities and development of the manufacturing sector. By doing so, poverty reduction has made progress. On the other hand, South African products dominate the market of Maputo city, which is the biggest market in Mozambique. No domestic products can compete with highly modernized and industrialized products from South Africa. Thus, this implies that South Africa hinders development of Mozambique local industries.

Mining of the largest coal source in Tete province and two development projects are under progress. The Vale of Brazil has been developing what is called the Motigaze project. It will produce 17.6 million tons of coals. The launch is planned for 2011. Another project is called the Benga project. It has been jointly developed by Riversdale of Australia and Tata Steel of India. It will produce 20 million tons per year and will be launched in 2011. Both projects will construct the thermal power plants. The impact of those big projects is not limited to Tete province but to whole economy of Mozambique.⁵⁷

3.4.3 Factors in Globalisation

Please refer to the section of 3.4.2.

IV Medical insurance and service targets people in poverty

There are no a medical insurance and services that specializes in people living in poverty. However, a free medical service is provided to all citizens. It means that there is no public

⁵² Republic of Mozambique (2010) "Report on the Millennium Development Goals"

⁵³ Afribiz <http://www.afribiz.info/content/remittance-inflows-into-african-countries>

⁵⁴ This tendency is especially remarkable when the woman supports the household economy.

⁵⁷ Ministry of Foreign Affairs "the Mozambique general view"

share of medical costs. The free medical service includes medical consultation and basic medical goods. Free distribution of ARV to HIV patients is included. These costs are covered by budget support assistance from the PAPs. Thus, the delay of disbursement that happened in 2010 made the ARV scheme dysfunctional and caused the chaos on the ground⁵⁸.

Price control of bread and oil was been implemented as measure for people living in poverty. The oil price is maintained 1USD per a liter. The bread price remains low to make affordable for the poor. It is a vestige of socialist policies where the control of prices is designed to alleviate poverty. The announcement of a rise in the price of bread in September 2010 triggered off a full-scale insurrection in Maputo which expanded to the whole of Mozambique⁵⁹. It underpins the importance of the price control to people in Mozambique.

V. Financial service which the poor can use

5.1 Microfinance

Only 14 percent of the population has access to a financial organization in Mozambique. It has been an urgent task of the government to establish new financial structures to increase accessibility of people in poverty to banking. The government and the Bank of Mozambique have developed new regulations to improve this situation. The introduction of micro financing is one of measure introduced. It was a strategy that Pascoal Mocumbi, then Prime Minister of Mozambique, announced whereby Mozambique would set itself the target of reaching 100 000 microfinance beneficiaries in the Washington World Micro Credit Summit in 1997⁶⁰. In 1998, “the General Guideline for rural development in Mozambique” (Resolution 3/98) was approved and it promoted a microfinance service in the agricultural sector. In 2005, the beneficiaries reached to 100 000 people⁶¹. The government continues to put effort into promoting microfinance in Mozambique⁶². The National Directorate of Rural Development and Promotion (DNDPR) has been instrumental in the development of the microfinance studies, including the National Microfinance Strategy. It organizes three national microfinance conferences, and hosts steering committees for the country’s major microfinance programmes. The government’s non-intervention policy in letting the microfinance sector evolve has been crucial⁶³. The DNDPR produced various policies and strategies and the Bank of Mozambique supervises microfinance organizations. It is a challenge that the services and activities have concentrated

⁵⁸ It is based on local hearing results of an investigation.

⁵⁹ That whose bread of 3Mt was 6Mt at 4Mt rose in price and used 7Mt.

on in urban areas and limited number of organizations provide microfinance services in rural areas. Table 5-1 below shows data on microfinance in 2009.

Table 5-1 MFI data of Mozambique

Gross loan portfolio USD, 2009	62.2 million
Number of active borrowers 2009	90,258
Average loan balance per borrower USD, 2009	336.5
Deposits USD, 2009	60.2 million
Total assets USD, 2009	36.3 million
Number of depositors 2009	278,983

Source: MIX Microfinance Information eXchange

(<http://www.mixmarket.org/mfi/country/Mozambique>)

International NGOs such as CARE and World Vision started to implement microfinance projects in the 1990s. The service then spread to urban areas. In the process of its development, main actors have shifted from major international NGOs to local NGOs, which have had support from international NGOs. The number of microfinance organizations has fluctuated: 42 in 1997, 29 in 2002 and 32 in 2005. There are only 8 organizations providing microfinance services in rural areas⁶⁴. The majority of the organizations focus on urban areas. However, these organizations and their activities contribute to rural development, especially the promotion of cashable production and commercialization of agriculture. It is said that tobacco production, which is a key source of foreign currency in Mozambique, achieved drastic growth due to microfinance support⁶⁵. The Bank of Mozambique supervises microfinance implementation. It is involved in issuing licenses and the supervision and monitoring of services. Microfinance organizations are divided into three types, Micro bank, Credit Corporative, and others by scale and business targets.

Notes: 1USD=35Mt

As the Table 5-3 shows, it takes more time to familiarize the public with financial services. The number of new accounts being opened is increasing but is restricted to urban areas. The performance in rural areas is very limited.

Table 5-3 Impact (2010) of each financial institution

	Deposit		Credits	Bank branches / 100,000
	Number of Accounts	% of GDP	% of GDP

Notes: The number of accounts is per 1 000 adults.

In addition to microfinance, informal financial services have become popular in Mozambique. The informal financial service, named Xitique, is a system that manages savings for the funeral of family members or close relatives (Funeral Association). It is well-known in Mozambique⁶⁶.

5.2 Mobile Banking

As at end June 2009, there were 21.6 million mobile users. This represents 22.4 percent of total population⁶⁷. The need mobile banking is high and expected to grow. However, there is a limited incidence of mobile banking within Mozambique. In December 2010, Mozambique Cellular, the state-owned cell phone company, better known as Mcel, launched the first mobile banking service. The service, which is called Mkesh⁶⁸, will be operated by Carteira Moval SA. The service aims to enable safe and easy access for the entire population to financial services such as storing and moving money without owning a traditional bank account. To join, all a person needs to do is go to a store (Mcel or any other agent authorities Mkesh the country) with a photocopy of one of these documents, identity document, passport, and voters card. The person requests the activation of an account. With Mkesh, customers can transfer money to friends and family, and make payments for goods and service. It is possible to send money to people even if they are not Mkesh service users. Thus, there is streamlines trade in the sub-urban and rural areas which contributes to the growth and prosperity of the country.

IV. Livelihood Support to people and households in poverty

The social security system of Mozambique is defined by Law Number 3/2007. Social security is divided into the following three systems, basic Social Security System for people living in poverty, Compulsory Social Security for employees and additional Social Security for self-employed workers.

⁶⁶ Fion de Vletter (2006)"Microfinance in Mozambique Achievements, Prospects & Challenges"

⁶⁷ ITP. Net <http://www.itp.net/579905-mozambique-to-gain-third-mobile-operator>

⁶⁸ Mkesh web site is http://www.mkesh.co.mz/?page_id=5

The Ministry for Women and Social Action takes responsibility for the Basic Social Security System through the National Institute of Social Action of Mozambique (INAS) - created in 1997. The system benefits people who are incapable of working and includes, people living in abject poverty, children, the elderly and persons with disability and degenerative disease⁶⁹.

There are a few programmes under the Basic Social Security System, such as:

- the Direct Social Support Programme
- the Social Benefit for Work
- the Community Development Programme

Table 6-1 The programmes under the Basic Social Security system

Scheme name	Overview
Food Subsidy Program	: The programme started in 1990. Its targets are people incapable of working.
Direct Social Support Program	: Targets people living in abject poverty. They need direct intervention and support by the government.
Income Generation Program	: The purpose is to acquire marketable skills in rural areas (mainly agricultural skills).
The Benefit for Work	: Its purpose is to provide opportunities to participate in economic activities.
Community Development Program	: Infrastructure development to increase the accessibility to the basic service.

Source: <http://south-south.ipc-undp.org/component/k2/item/210-mozambique>

Mozambique's Social Protection Strategy focuses primarily on subsidized education and basic health. There are two schemes, the National Program against HIV/AIDS, and the Minimum Income for School Attendance. The former scheme provides 100 USD per year to home care patients. There were 5,500 beneficiaries in 2010. The scheme pays the patient who is recuperating at home from the AIDS infection - about 100 dollars in every year, 5,500 persons are benefiting as of 2010. The latter scheme is a joint pilot project of the Ministry of Education and Culture, ILO and UNCTAD. It focuses on poor rural households with children of school-going age and reaches 5 000 families with 2 USD per month per child⁷⁰.

V. Poverty reduction monitoring

Mozambique has implemented PARPA which is a national poverty reduction strategy (mentioned earlier). The PARPA sets strategic targets on poverty reduction by 2015 through

⁶⁹ South-South learning on social protection

⁷⁰ <http://south-south.ipc-undp.org/component/k2/item/210-mozambique>

economic development. The progress is reported in “Report on the Millennium Development Goals” with the support of the UNDP. The MPD is the institution that is responsible for poverty issues and the collection of information on poverty. In addition, the MPD consultants with related ministries and G20 have implemented the poverty reduction strategies. Regarding poverty monitoring, the government and PAPs signed a Memorandum of Understanding and developed a framework to monitor progress of poverty reduction strategy. Since then, an annual joint review of poverty reduction is held twice a year. The review determines the amount of budget support. The results of the review are agreed as “Aide-Mémoire” by both parties and are open to the public⁷¹.

⁷¹ Measure towards framework construction more comprehensive than the assistance cooperation - in Sakumoro Rie (2008) Mozambique

Table 7-1 Overview of the Progress of Mozambique toward the MDGs

Millennium Development Goals	Index	1997	2003	2009	Mozambique governmental target (2015)	MDGs achievement prospect

Source: Republic of Mozambique "Report on the Millennium Development Goals" (2010)

Most of index in Table 7-1 shows that MDGs are improving by comparison with 1997. There is a great improvement in two focused areas by the government, namely education and the child mortality rate. However, there are still gaps with targets of MDGs and it will be a challenge to achieve these targets by 2015. The index that follows explains the situation in more detail.

(1) Goal 1: Reducing Extreme Poverty

In order to achieve the MDGs targets, this indicator means the country should reduce the incidence of poverty to 40 percent in 2015⁷³. The proportion of the population living below the national poverty line in 2008/09 improved to 54.7 percent at the national level. However, the country has a long way to go to achieve the MDG targets. There were no statistically significant changes between 2002/03 and 2008/09⁷⁴. The population living under poverty is estimated to have increased from 9.9 million in 2003 to 11.7 millions in 2008/09. The rate of incidences across the three provinces - Niassa, Cabo Delgado and Tete - remains at relatively lower: between 31 percent and 42 percent. On the other hand, Maputo, Zambezia, and Gaza provinces are high: between 60 percent and 70 percent. There is also gender gap in poverty indices. The families headed by women have higher levels of poverty than those headed by men: a difference of 5 percent.

Table 7-2 Percentage of families in absolute poverty in Mozambique 1997-2009

	1997	2003	2009
Male headed household.	69.9	51.9	53.9
Female headed household	66.8	62.5	57.8

Source: Republic of Mozambique (2010) "Report on the Millennium Development Goals" P15

According to "Report on the Millennium Development Goals", the cause of higher poverty are:

- lower productivity in agriculture
- aggravation of trade due to increase of international food and fuel
- cumulative effect of the HIV/AIDS epidemic

⁷³ Since it was 80% as of 1990, the reduction by half means 40%.

⁷⁴ Republic of Mozambique "Report on the Millennium Development Goals" (2010)

In addition, poor domestic distribution systems prevent market information exchange. This is problematic for the disposal of surplus food. It is estimated 30 percent of agricultural production is wasted. Table 7-3 presents the data of the globally common poverty line in Mozambique. This was announced by the World Bank.

Table 7-3 Poverty Index

	1997	2003
Poverty Gap at \$1.25 a day (PPP) (%)	42	35
Poverty Gap at \$2 a day (PPP) (%)	59	54
Poverty headcount ratio at \$1.25 a day (PPP) (% of Population)	81	75
Poverty headcount ratio at \$2 a day (PPP) (% of Population)	93	90

Source: World Databank (<http://www.worldbank.org/>)

(2) Goal 2: Achieving Universal Primary Education

There are two grades of primary education, first level (G1-G5) and second level (G6-G7). According to "Report on the Millennium Development Goals", the enrolment rate of primary education has been improving from 22 percent in 1997 to 77.1 percent in 2010. Maputo city is about to reach 100 percent enrolment rate (currently 95.9 percent). The worst performing province is Tete province at a rate of 69 percent enrolment. It is expected to achieve the targets of MDGs.

There are geographical and gender disparities. The enrolment rate is:

- boys in urban areas is 89 percent
- girls in rural areas is 77 percent

Table 7-4 Net primary school enrolment rate for school-going age children by areas of residence and by sex in Mozambique 2008

Source: Republic of Mozambique "Report on the Millennium Development Goals" (2010)

The completion rate of primary education is varied by provinces. Maputo city and Maputo province achieved over 90 percent. However, Cabo Delgado and Tete provinces showed poor performance, around 60 percent.

Table 7-5 Net primary education (1st level) completion rate by province in Mozambique, 2008

Source: Republic of Mozambique "Report on the Millennium Development Goals" (2010)

As seen above, the quality of education is a newly emerging challenge. Further efforts are necessary to overcome it.

(3) Goal 3: Promotion of Gender Equality and Empowerment

The girl-boy ratio of primary education has increased to 0.9 since 1997. The Multiple Indicator Cluster Survey (MICS) (2008) of UNICEF showed that the national girl-boy ratio is 0.97 (0.99 in urban areas and 0.96 in rural areas). It is estimated to achieve the three targets of MDGs. However, there are gender disparities in the completion rate. The boys' completion rate is 79.7 percent and the girls' completion rate is 74.4 percent. The female illiteracy rate has improved but is still high. It was 74.1 percent in 1997 and improved to 56 percent in 2009. This is attributed to the traditional way of thinking that there is a lower need for girls to be educated and a high maternity rate. Vocational training to meet requirements in the market will be a new challenge for this sector.

(4) Goal 4: Reducing Child Mortality Rate

The mortality rate for children five and under reduced to 138 per 1 000 in 2008 from 245.3 per 1,000 live births in 1997. This means that one in four children will not live longer than six years. This trend is applicable to the infant mortality rate. Improvements in the immunization rate have contributed to the drastic drop in the mortality rate. The immunization

rate of the diphtheria pertussis tetanus vaccine (DPT) improved from 55 percent in 1997 to 64 percent in 2008. The measles immunization rate increased to 71 percent from 58 percent. In particular, 85 percent of infants in urban areas had been immunized. This reflects an improvement in accessibility to health facilities. According to the National Assessment of Maternal and Neonatal Health Needs in Mozambique, the main causes of institutional neonatal deaths are:

- premature birth (50%)
- serious suffocation (32%)
- neonatal sepsis (29%)

In the first 7 days after delivery, 49 percent of neonatal deaths happen⁷⁵. This data indicates further development of health facilities is an urgent issue in the healthcare sector. There has been limited improvement in the malnutrition rate among children 5 years and under. It has reduced by only 4 percent in the last 5 years (2003 to 2008). Poor nutrition is considered to be one of the main causes to a higher infant mortality rate.

(5) Goal 5: Improvement Maternal Health

Antenatal care coverage with at least one visit is well spread and the rate reached 92 percent in 2007/8. However, the maternal mortality rate (per 1 000 000 live births) remains high at 500 deaths in 2007/08. It was small improvement (142) compared to 1997. It is far beyond the MDGs target, which achieves 250 per 100 000 live births. One of the causes for the higher maternal mortality rate is a lower rate of delivery in the well furnished health institutions. The report on the “Millennium Development Goals” shows that the national coverage of institutional deliveries was 58 percent in 2008. There is also regional disparity:

- 81 percent in the urban areas
- 49 percent in the rural areas

There has been some improvements in relation to the 2003 data (34%)⁷⁶.

(6) Goal 6: Combat HIV/AIDS, Malaria and other disease

The spread of HIV/AIDS is a threat to the development in Mozambique. The prevalence of HIV/AIDS among adults 15 to 49 years old has worsened: from 8.6 percent in 1997 to 11.5 percent in 2009. The prevalence rate is higher in women (18.4 percent) than in men (12.8 percent).

Source: Republic of Mozambique (2010)"Report on the Millennium Development Goals"P80

Looking at provincial disparities, Gaza province has the highest prevalence rate of 25.1 percent. On the other hand, Niassa province has the lowest rate of 3.1 percent, which is only one-eighth of Gaza province. The difference in people's movements could be a reason for the disparity. Gaza province is the main provider of migrant labor to the South Africa mining sector, while Niassa province is located in the north and has limited access to South Africa. South Africa is one of the countries suffering from highest prevalence rate of HIV/AIDS in the world. It is easily expected that migrant workers become infected in South Africa and take the disease to Mozambique.

(7) Goal 7: Ensuring environment sustainability

As explained in Point 2.2.6, the percentage of the population with access to an improved water source has made progress: from 37.3 percent in 1997 to 56 percent in 2009. The expectation is that the country will achieve MDGs targets in 2015. However, the regional disparity is a crucial challenge in Mozambique. According to the MICS (2008), Maputo city achieved 94 percent, Zambezi province remains at only 24 percent, Cabo Delgado province achieved 30 percent and Manica province achieved 32 percent. The data by provinces is shown in the Table 7-6.

Table 7-7 Rate of population with access to an improved water source

Niassa province	44
Cabo Delgado province	30
Nampula province	43
Zambezia province	24
Tete province	34
Manica province	32
Sofala province	48
Inhambane province	35
Gaza province	61
Maputo province	68
Maputo city	94

VI. Methodology to update poverty profile in Mozambique

Mozambique has fundamental data and information, such as, “Poverty and Wellbeing in Mozambique”, “Report on the Millennium Development Goals”, the census to comprehend and analyze the poverty situation. The surveys above have offered the best and most effective methodology for understanding the poverty situation in Mozambique over the years and to track the data. In addition, a lot of international organizations have conducted their own research for their own sake and these those documents are open to the public. Typical documents of international organizations include, “Multiple Indicator Cluster Survey” of UNICEF and “Human Development Indicator” of UNDP. The table below lists the documents that the report referred to - and includes the publishers, frequency of update, and recent updated date.

Documents	Publishers/Authors	Frequency of update	Updated Date
Census	INE	Every 10 years	2007
Report on the Millennium Development Goals	Republic of Mozambique	Every year	2010
Poverty and Wellbeing in Mozambique	MPD	Every 5 years	2010
Household Survey	INE	Every 5 years	2008/09 Not open to the public
Multiple Indicator Cluster Survey	UNICEF	Irregular date	
World Government Indicator	World Bank	Every year	
Human Development	UNDP	Every year	

Indicator			
African Economic Outlook	AfDB	Every year	
National Profile of Working Conditions in Mozambique	ILO	n/a	
World Governance Indicator	World Bank	Every year	
Financial Access	World Bank/CGAP	Every year	
Comprehensive Food Security Vulnerability Analysis	WFP	Every year
