# [ Main Characters ]

## Government of Nepal

**Bindu Shamsher Rana**  
Project Director,  
key figure on the  
Nepalese side

## JICA expert

**Toshio Kimata**  
JICA expert  
dispatched to  
the Department  
of Roads

## Nippon Koei

**Hiroki Shinkai**  
Lead Engineer

**Yoshihisa Yamashita**  
Key contributor

**Hideo Katagiri**  
Supervised  
construction on  
site for 12 years

## Hazama-Taisei

**Akira Noguchi**  
Site Manager,  
Section 1

**Masanobu Kadowaki**  
Site Manager,  
Section 4

**Shizuo Murata**  
Site Manager,  
Section 2

**Yoshinori Izawa**  
Site Manager,  
Section 2; deputy  
site manager for  
Section 3

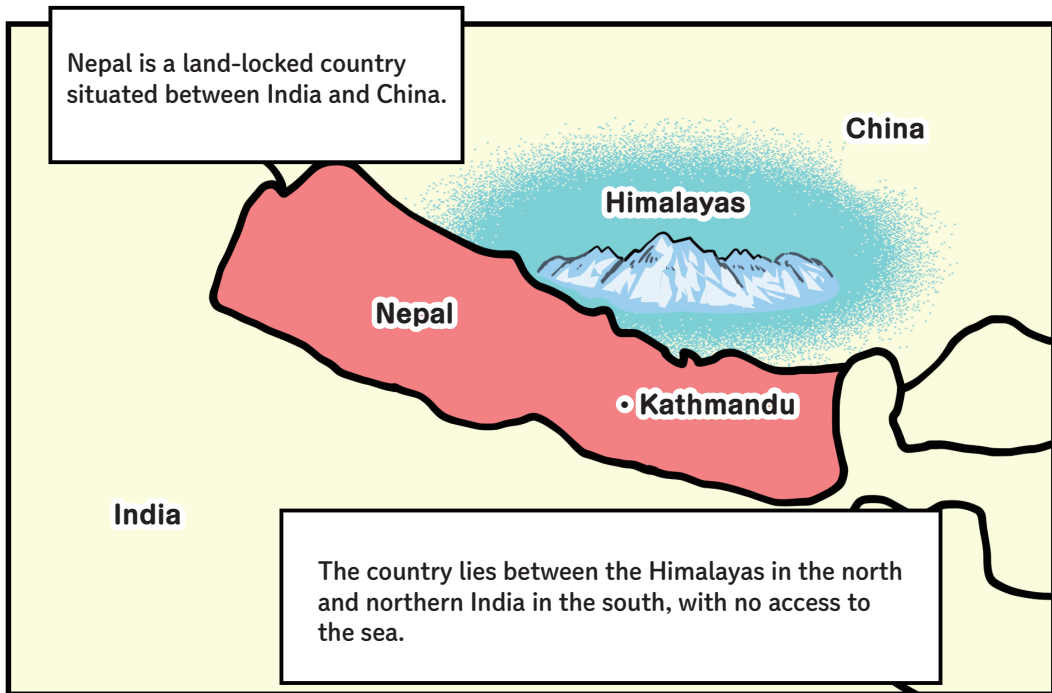

**Tetsuo Igari**  
Site Manager,  
Section 3

Nepal, 1986

Can we really build  
a road here...?

However, frequent landslides  
— caused by heavy rain and the  
mountainous geography —

often disrupted road connections  
between India and Nepal.

We urgently need an  
alternative disaster-resilient  
supply route...

Government of Nepal

In response to Nepal's strong and urgent need, JICA launched a study for the Sindhuli Road in 1986.

The study was led by Hiroki Shinkai of Nippon Koei,

who dedicated over 30 years to the project.

As a civil engineering student, Shinkai was inspired by Nippon Koei's overseas development work and decided to join the company.

He began with infrastructure projects in Japan, later contributing to international road projects in Malaysia and Uganda.

Eventually, he led the Sindhuli Road project with lifelong dedication and passion.

To connect Dhulikhel, near Kathmandu, with Bardibas, which connects to India,

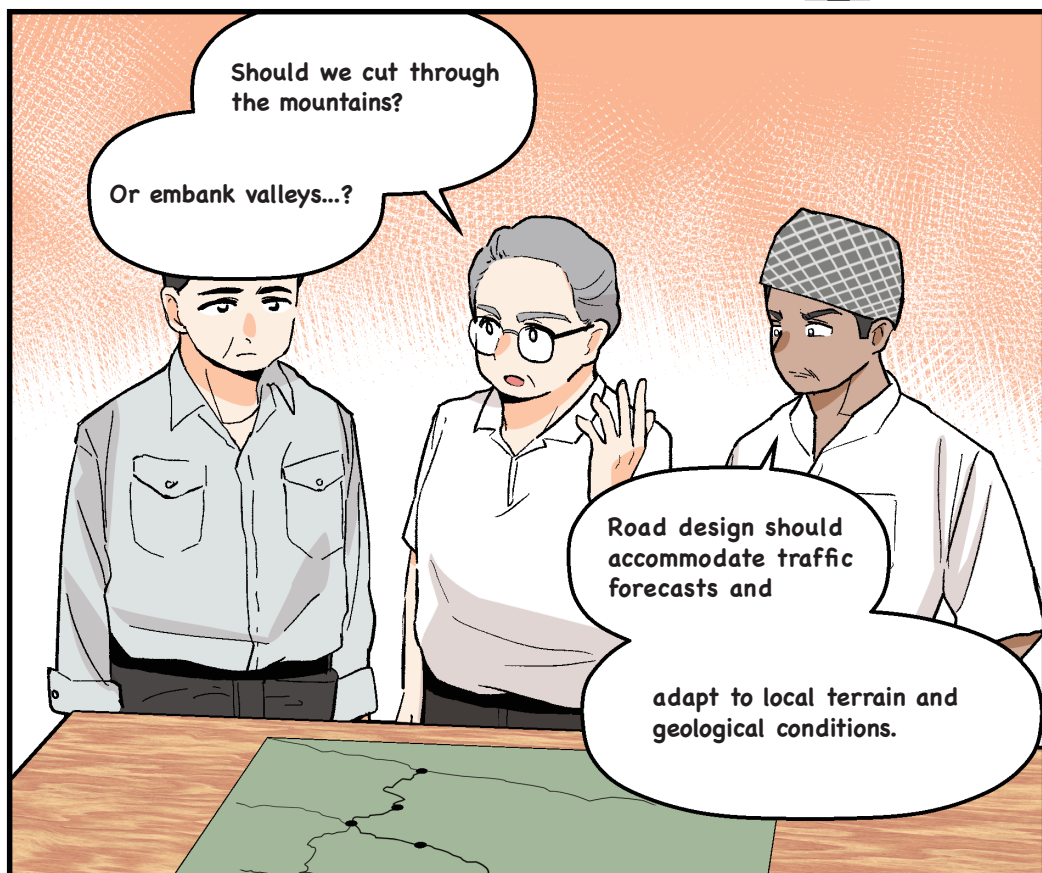

the road must pass through Mahabharat Mountain Range, which stands over 2,000 meters high.

This fault is fragile and earthquake-prone,

requiring countermeasures against unstable geology and landslides.

Should we cut through the mountains?

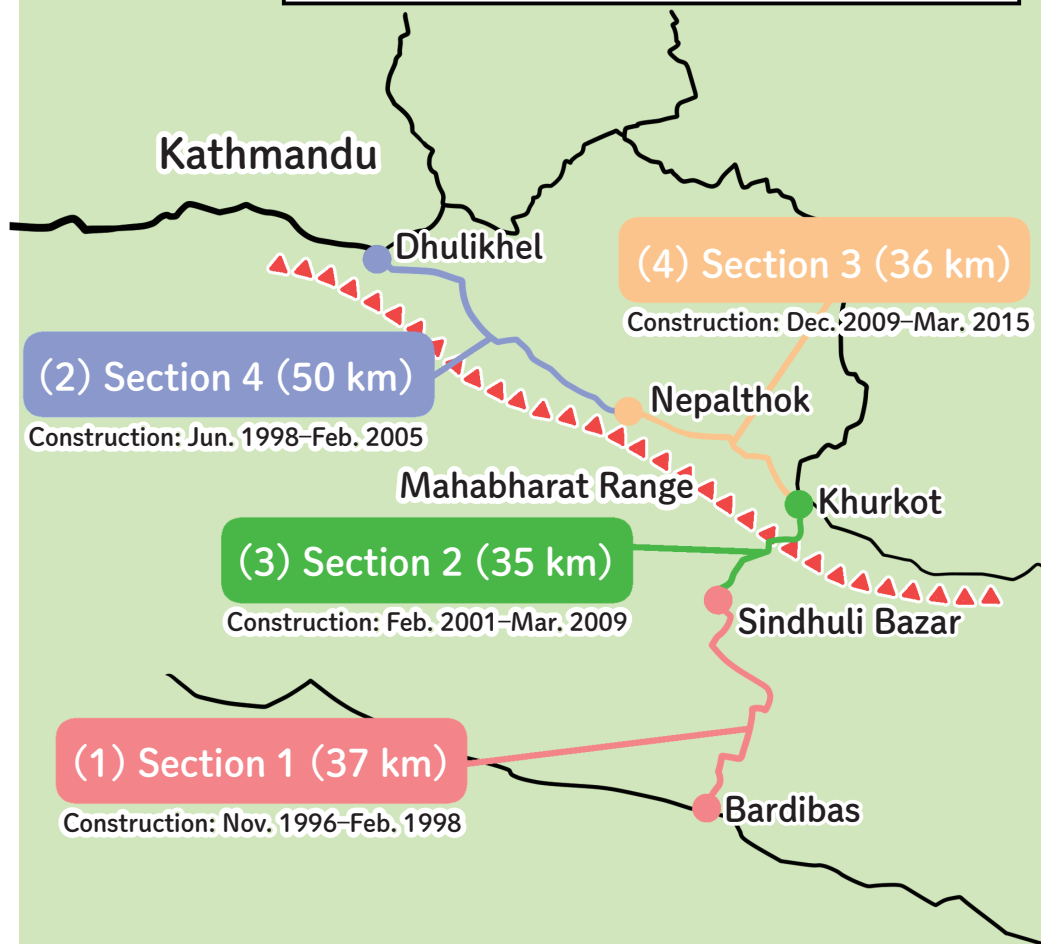

Or embank valleys...?

Road design should accommodate traffic forecasts and

adapt to local terrain and geological conditions.

With Grant Aid Assistance by the government of Japan,

the Sindhuli Road project became a 20-year mega-project between Japan and Nepal.

\* The road was a completely new road that required clearing jungle-covered mountains.

# [Project Stakeholders]

**Government of Nepal**  
Department of Roads, Ministry of  
Physical Infrastructure and Transport  
Project owner (client)

**Hazama-Taisei \***  
Construction contractor

**Nippon Koei**  
Consultant responsible for technical and  
construction supervision

**JICA**  
Responsible for project planning, surveys,  
monitoring, and coordination

\* Construction was carried out by a joint venture between Hazama Corporation and Taisei Corporation, and Hazama Ando Corporation. For simplicity, they are referred to as “Hazama-Taisei” in this publication.

1996: Construction of  
Section 1 begins

For Section 1, Nepal will  
build the road using heavy  
equipment provided by  
Japan.

We are building bridges  
over rivers and improving  
the road.

9 bridges and 17 causeways...

can we really complete all this  
in just 18 months?

The rainy season (Jun.-Sep.)  
makes work nearly impossible,

we actually have  
even less time...

Abutment

Bridge

Columns

Abutment

Let's start by building the foundations  
for all 9 bridges simultaneously and  
finish construction in the dry season!

Despite the need to work quickly, many problems occurred.

Remote mountain location made securing and transporting rebar and cement very difficult.

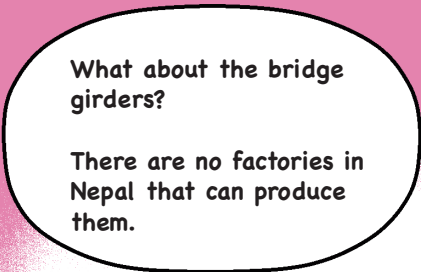

Restrictions on explosives meant even big boulders had to be broken manually.

Then, a nationwide bandh\* occurred

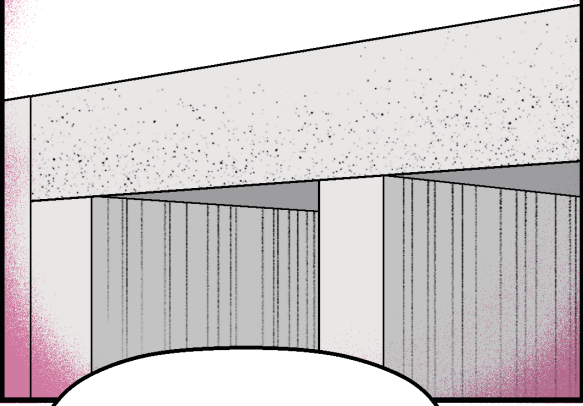

\* Bandh = a form of strike by workers to show political protest or to protect their rights.

What about the bridge girders?

There are no factories in Nepal that can produce them.

We also don't have trailers or cranes to transport them.

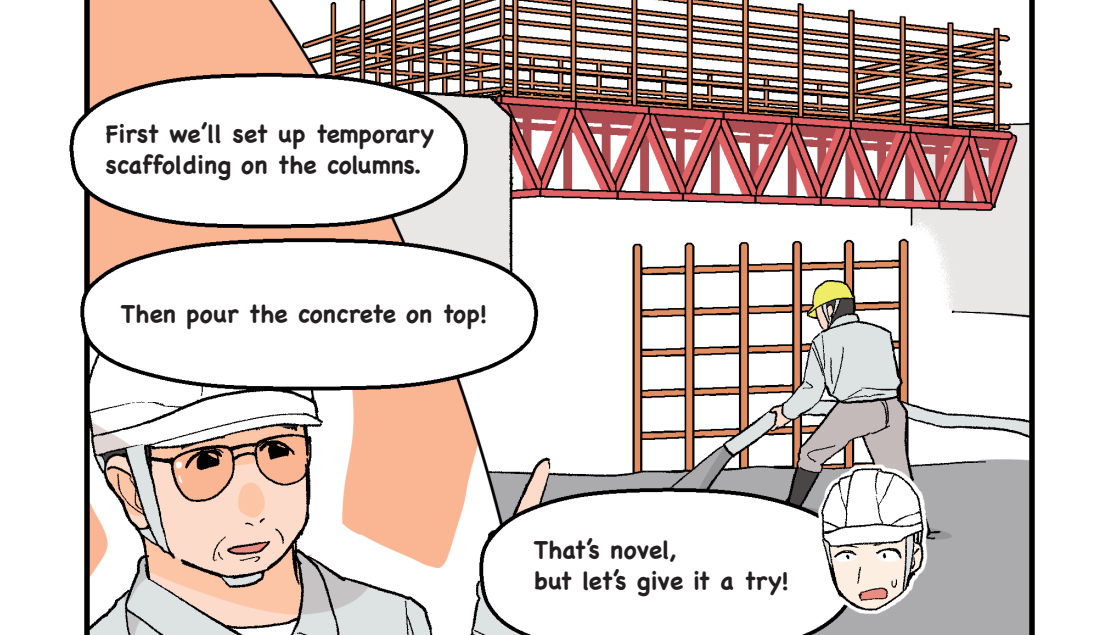

What are we supposed to do...?

We'll build them on site!

Is that even possible?

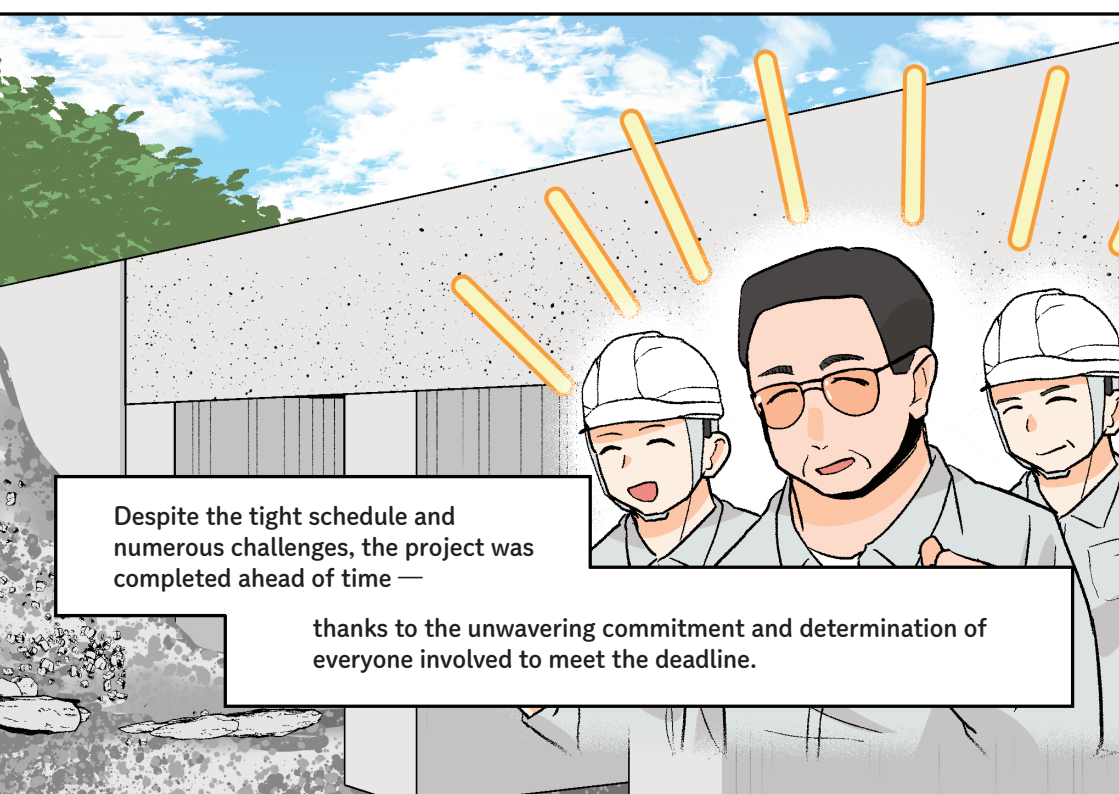

First we'll set up temporary scaffolding on the columns.

Then pour the concrete on top!

That's novel,  
but let's give it a try!

Thanks to Hazama-Taisei's outstanding technical expertise, the work finished 4 months ahead of schedule.

Despite the tight schedule and numerous challenges, the project was completed ahead of time —

thanks to the unwavering commitment and determination of everyone involved to meet the deadline.

1998: Construction of  
Section 4 begins

Local residents were  
hired as workers.

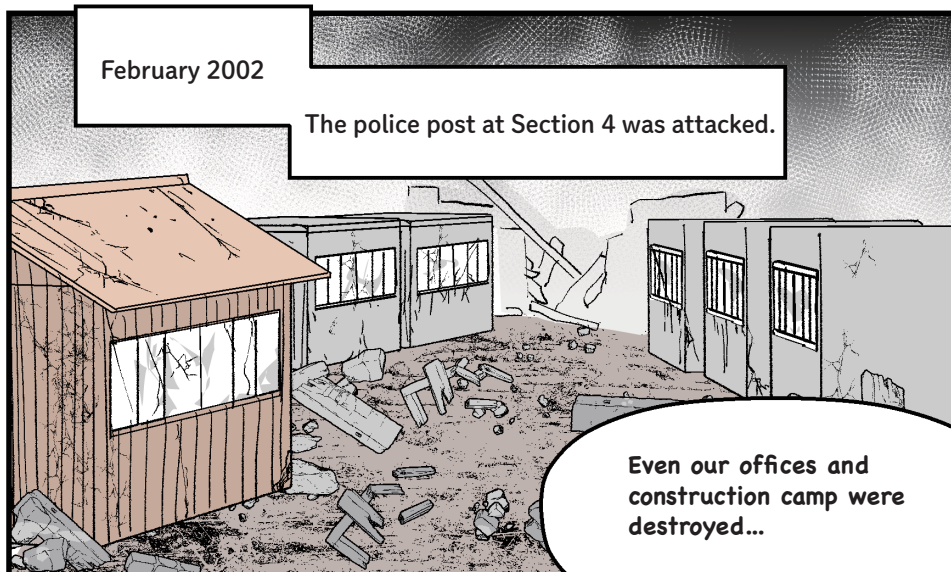

The work was  
conducted under  
patient guidance.

Then...

Something terrible happened!!  
Do NOT go outside!!

In June 2001, the Nepalese royal massacre occurred

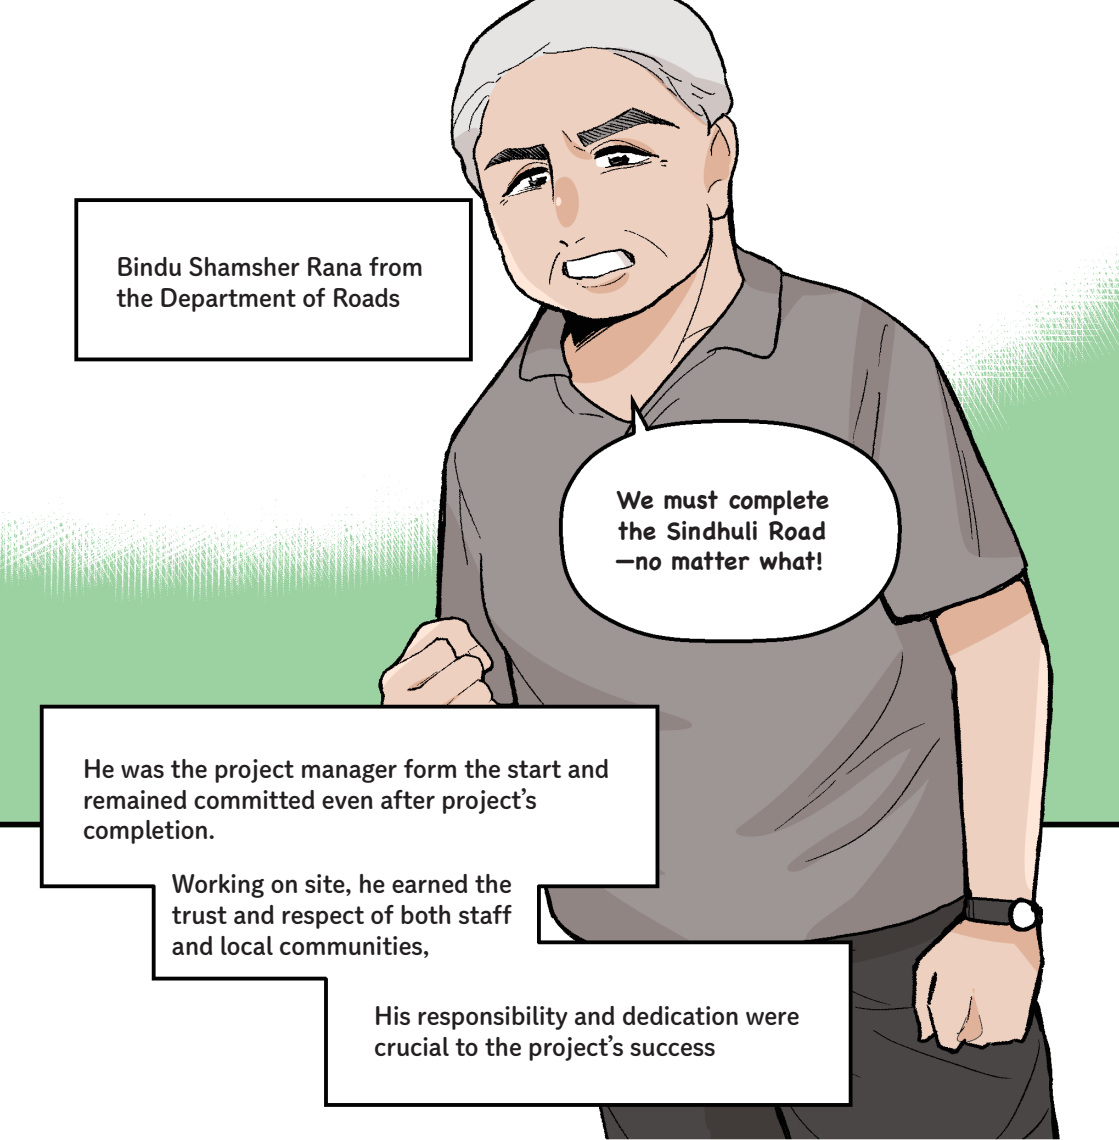

Maoists = Communist Party of Nepal (Maoist). They were the leading force behind the Maoist insurgency against the government which started in 1996 and became known as the People's War.

Amid deteriorating security  
affecting construction progress,

a man striving to resolve issues  
with Maoists and locals is ...

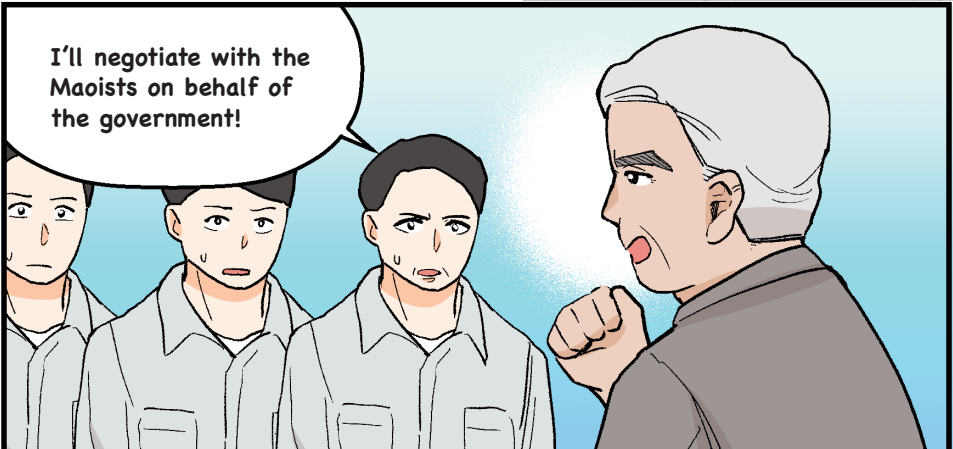

Bindu Shamsheer Rana from  
the Department of Roads

We must complete  
the Sindhuli Road  
—no matter what!

He was the project manager from the start and  
remained committed even after project's  
completion.

Working on site, he earned the  
trust and respect of both staff  
and local communities,

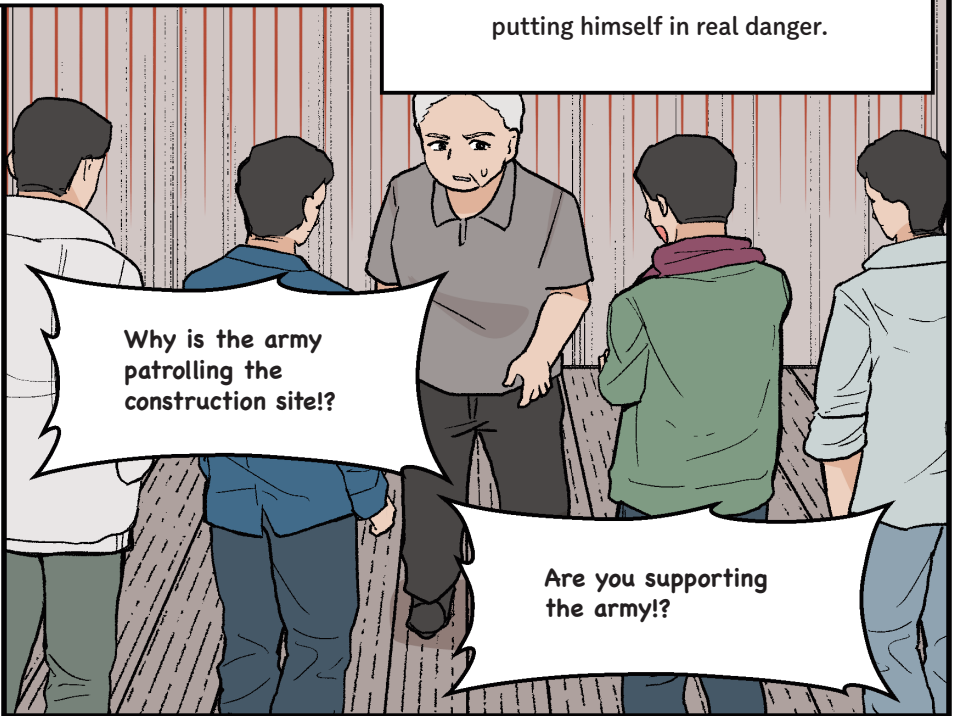

His responsibility and dedication were  
crucial to the project's success

I'll negotiate with the  
Maoists on behalf of  
the government!

Rana kept communicating both officially and unofficially with the Maoists,

putting himself in real danger.

Why is the army patrolling the construction site!?

Are you supporting the army!?

No! The Sindhuli Road construction has nothing to do with politics or the army!

It's all for the people of the villages!

\* In July 2002, record-breaking rains damaged infrastructure across Nepal.

Despite worsening security and delayed repairs, Section 4 was finally completed in Feb. 2005.

2001: Start of Section 2

Section 2 crosses  
steep mountains and  
seismic zones,

including 8 landslide sites—  
the toughest part.  
To tackle this, we'll need..."

High embankments — about 190,000 m<sup>3</sup> of  
soil, equivalent to 32,000 10-ton truckloads,  
were used to fill and shape the valley.

Culverts were built to allow debris to pass  
through and prevent road blockages.

Around them, 16 m high reinforced retaining  
walls were constructed for earthquake  
resistance.

Temporary roads were also built to bring  
in heavy machines.

A joint survey team from Nippon Koei and Hazama-Taisei introduced enhanced safety measures.

As a result, Section 3's first half achieved 4.8 million hours.

## पहिले सुरक्षा Safety First

In the latter half, a record of 4.5 million hours of accident-free work was achieved.

\*Achieving 2.3 million accident-free hours of road construction qualifies for official recognition.

2009: Start of Section 3

Finally, the last section.

Let's build a road that serves as a model for Nepal.

First, we need to improve safety and prevent vehicles from falling.

Let's install concrete guard blocks at dangerous spots.

Guardrails are standard in Japan,

but that's not always possible here in Nepal.

The road must be fully paved!

Gravel roads kick up dust and get muddy in the rain.

This is a road supported by Japan!

We should aim for comfort and environmental consideration.

This is the culmination of our work —

— a fully paved road with safety features, smooth driving, effective drainage, and disaster protection. It stands as the project's greatest achievement.

Sindhuli Road's final challenge: Sadhi

We'll call the "Ninja team"

where the slopes are  
too steep for machines  
to reach.

The Ninja team were Nepalese staff trained by Japanese experts in high-rise construction for Section 2.

They got their nickname

because they worked at heights using ropes instead of scaffolds

— just like real ninjas.

People grow through many years of hard work.

It's amazing — Nepalese are learning Japanese skills.

Meanwhile, demands from local residents increased.

The locals have locked up  
our project staff!?

They're demanding jobs for locals  
and payment to use land.

The rise in local demands was partly due to the intensification of pro-democracy movements following the king's suspension of parliament in 2005.

After the civil conflict ended in 2006, and as nation-building continued, the voices of the people gradually grew stronger.

The office keys have been stolen and we've had to stop work!

Residents are blocking us, and the concrete mixer trucks can't move. We are totally stuck!

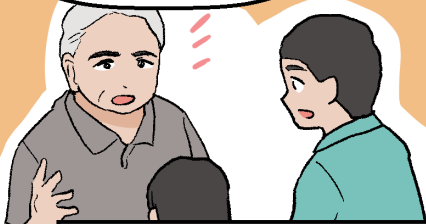

A lot of these requests have nothing to do with our project

but as long as our work is being blocked,

we must respond to the protesters with care.

Nippon Koei, Hazama, and the Department of Roads worked together to resolve

any claims or issues that arose during the project.

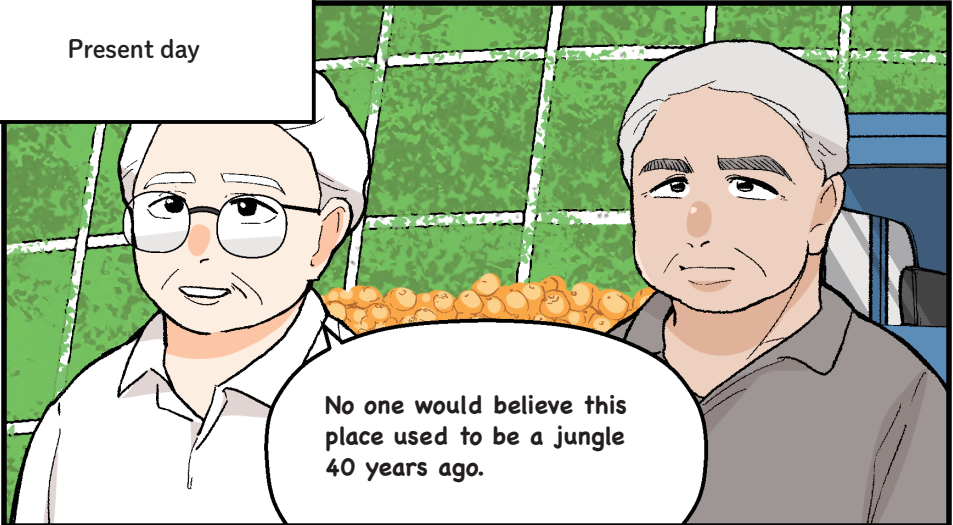

Mar. 2015: Section 3 is completed

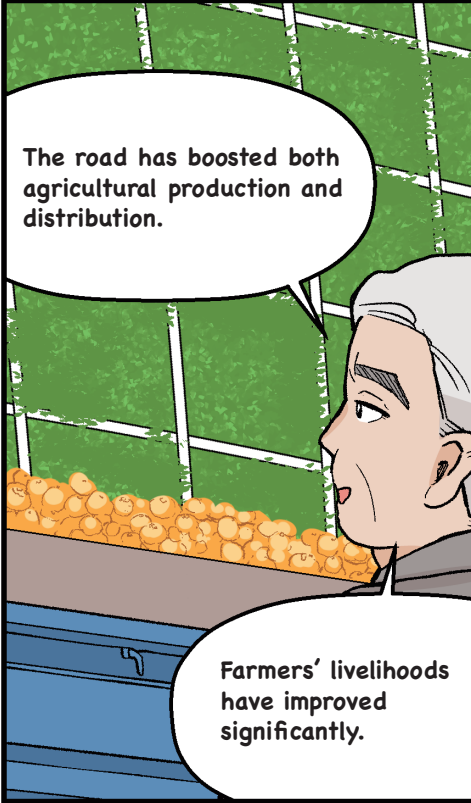

After 20 years, the Sindhuli Road is complete — a lasting symbol of Nepal – Japan friendship.

Present day

No one would believe this place used to be a jungle 40 years ago.

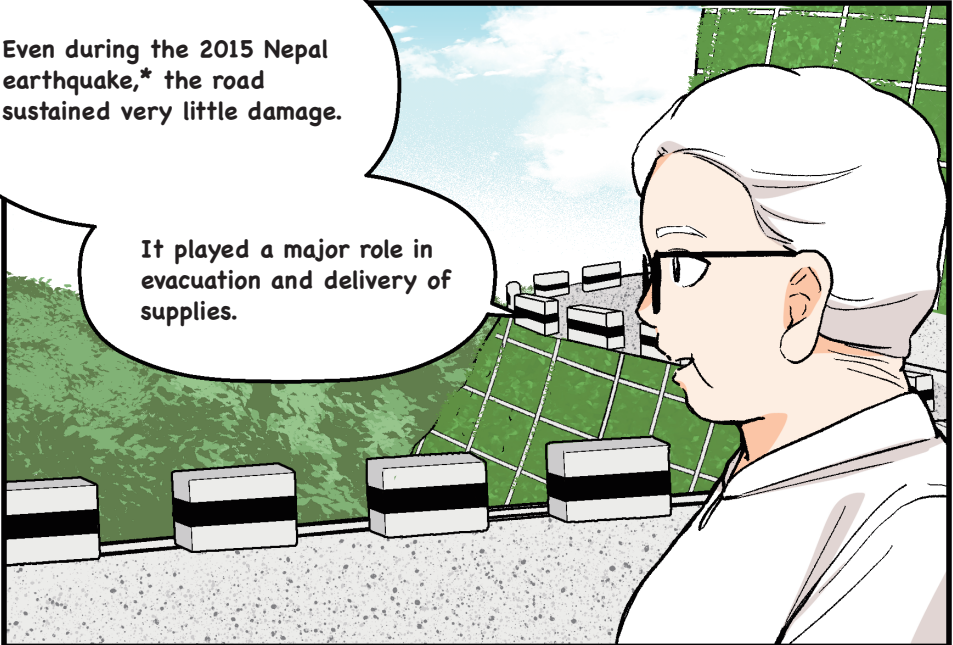

The road has boosted both agricultural production and distribution.

Farmers' livelihoods have improved significantly.

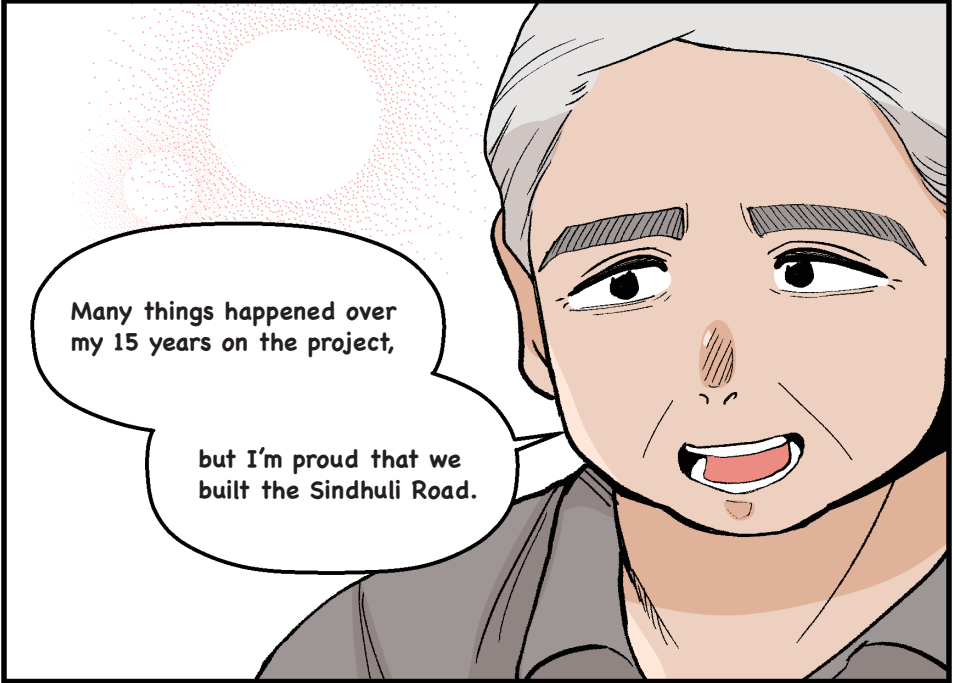

Access to hospitals has improved,

contributing to saving lives.

Even during the 2015 Nepal earthquake,\* the road sustained very little damage.

It played a major role in evacuation and delivery of supplies.

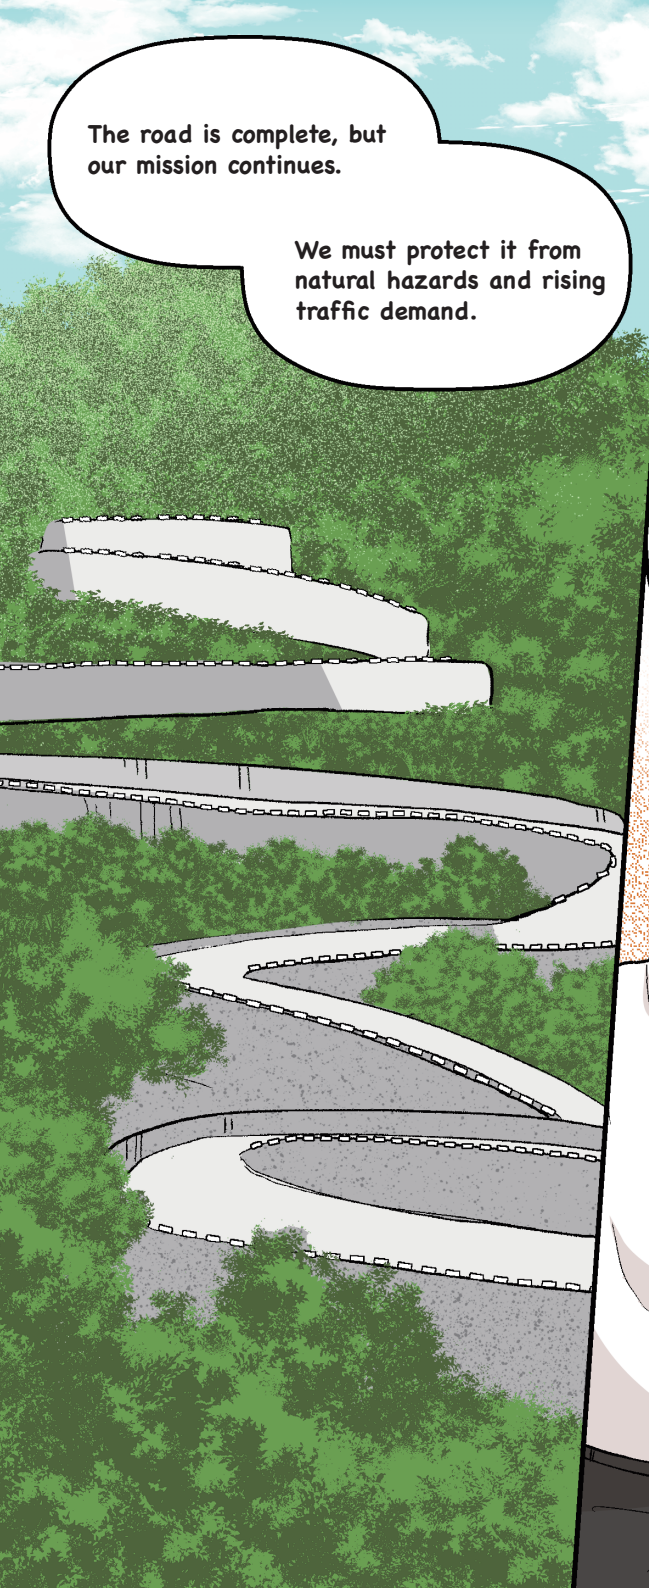

Many things happened over my 15 years on the project,

but I'm proud that we built the Sindhuli Road.

\* 2015 Nepal earthquake (Gorkha earthquake)

A quake in central Nepal that claimed approximately 9,000 lives and caused extensive damage across the country.

A perspective view of a winding, two-lane road that curves through a dense, vibrant green forest. The road is light gray with white dashed lines marking the edges. The trees are thick and cover the hillsides, creating a sense of a secluded, natural environment. The sky above is a pale blue with soft, white clouds.

The road is complete, but  
our mission continues.

We must protect it from  
natural hazards and rising  
traffic demand.

A close-up of two elderly men. The man on the left has white hair, wears glasses, and a white polo shirt. He has a concerned expression with his mouth slightly open. The man on the right has gray hair and a dark gray polo shirt, looking on with a serious expression. They are standing in front of a background of orange and red foliage.

Let's keep protecting  
this road—together.

The Japan International Cooperation Agency (JICA) aims to promote international cooperation and provide assistance to developing countries, as a sole Japanese governmental agency in charge of Official Development Assistance (ODA) implementation. “Leading the World with Trust” as its vision, JICA, with its partners, will take the lead in forging bonds of trust across the world, aspiring for a free, peaceful and prosperous world where people can hope for a better future and explore their diverse potentials.

### **Developing roads supports people’s lives and promotes national economic development**

In Nepal, roads are vital lifelines but often disrupted by natural disasters. With Japanese cooperation, the Sindhuli Road — also known as BP Highway (NH13) — was constructed as an alternative route to India, fulfilling a long-awaited national goal.

Despite numerous challenges, including steep mountain terrain, difficult construction conditions, natural disasters, democratization movements, insurgency, and accidents, Nepal and Japan worked together to overcome obstacles and complete the road.

JICA ensured smooth project implementation through environmental and social consideration, community consensus-building, and coordination. Even after completion, JICA continues supporting operation, maintenance, and disaster recovery, contributing to better livelihoods and Nepal’s economic development.

For more information  
please check this out!

## Making the Sindhuli Road more disaster-resilient

In September 2024, record-breaking rainfall — the heaviest since 1970 — hit Kathmandu and eastern Nepal, triggering landslides and floods that claimed about 250 lives and severed major roads.

The Sindhuli Road was also damaged, with washouts and slope failures at 72 locations over 38 km due to river flooding.

Nepal's Department of Roads carried out temporary repairs such as detours, but full recovery has been difficult.

Japan provided grant aid for restoration, leveraging its disaster prevention expertise to rebuild quickly and strengthen resilience in 2025.

Building more resilient roads that withstand increasing disasters from climate change will ensure safer transport of people and goods and contribute Nepal's socio-economic development.
