Peru: A Similar Water Problem

Like neighboring Bolivia, Peru has plenty of water, but many of its 28 million population have difficulty accessing it. JICA has been working for many years with Bolivian authorities to overcome these problems in a variety of ways (the agency also works with other Latin American countries which face similar headaches.

In the latest joint project which began in 2008, nearly 300 deep and shallow wells are being dug annually and although JICA’s direct participation is scheduled to end in 2011, Fukushima said the government is expected to continue the schedule.

Small-scale enterprises have been established. In Sora village, for instance, a newly established factory sells and provides water to local communities. Small rivers are being dammed and used to generate electricity, and a recent sewage project begun with JICA’s assistance will sharply reduce pollution and provide cleaner water.

JICA has worked for many years with Bolivian authorities to solve the water problem and for the last several years has been involved in the government’s Agua Para Todos (Water for All) program.

JICA has been working for many years with Bolivian authorities to overcome these problems in a variety of ways (the agency also works with other Latin American countries which face similar headaches.

According to JICA expert Yoshinori Fukushima since 1998 an estimated 4,500 of the country’s 28,000 rural communities representing 70% of the population have received help.

Fukushima, an ethnic Japanese born in Bolivia, said nearly 4,000 shallow and deep wells ranging in depth from a few meters to 420 meters have been sunk, Huge water tanks were built and solar or wind power systems installed to provide power.
