

PEPPER PRODUCTION

Training Title: Pepper Production

Objective: To provide a guideline on production of Pepper

Specific Objective:

 To provide basic information on production, post-harvest handling, and marketing of Pepper

Contents:

- 1. Introduction: Background, Some Common Varieties and Optimal Ecological Requirements
- 2. Pre-Cultivation Preparation 1 5
- Cultural Practices 1- 9
- 4. Harvest
- 5. Post-Harvest Handling
- 6. Cost & Income Analysis
- 7. Post-Training Evaluation Exercise

Disclaimer

Pepper Production, First version was published by SHEP (Kenya) in 2009, revised by Ethio-SHEP in 2019 (Ver.1)

All rights reserved. This publication may be reproduced without permission for non-commercial use as long as the Ministry of Agriculture (MoA), Oromia Bureau of Agriculture, Bureau of Agriculture of Amhara region of the Federal Republic of Ethiopia and the Japan International Cooperation Agency (JICA) are acknowledged.

This publication was prepared under the Project for Smallholder Horticulture Farmer Empowerment through Promotion of Market-Oriented Agriculture (Ethio-SHEP) on behalf of Ministry of Agriculture, Horticulture Development Technology Transfer Directorate (HDTTD) of FDRE and Japan International Cooperation Agency (JICA).

The proposed agrochemicals are in accordance with "Pest Control Product Registered for Use in Edition, 2015". The registered agrochemicals are subject to change. Please refer to the latest registered agrochemicals by Plant variety release, protection and seed quality control directorate.

Preface

- This training material applies the fundamental practices essential for crop production and successful marketing to put into perspective the case of horticultural crop production.
- The fundamental practices are categorized into seven (7) broad topics and twenty (20) sub-topics; the twenty sub-topics are referred to as the General Horticulture Crop Production and Post-Harvest Handling Techniques (GHCP&PHHT20). This categorization is based on the Smallholder Horticulture Empowerment & Promotion (SHEP) experience in mitigating production and marketing challenges facing smallholder horticultural farmers.
- The seven (7) broad topics are: Pre-Cultivation Preparation; Land Preparation; Crop Establishment (Planting/Transplanting); Crop Management; Harvest; Post-Harvest Handling: and Cost and Income Analysis.
- The sub-topics under each topic are as follows: Pre-Cultivation Preparation (market survey, crop planting calendar(s), soil sampling & analysis, or using ETHIOSIS soil test results as well as regional soil labs, composting, and quality seed/planting material(s)); Land Preparation (land preparation practices, incorporation of crop residues, and basal application); Crop Establishment (raising seedlings, planting/transplanting, fertilizer application); Crop Management (water requirement, managing of weeds, top-dressing, pests & diseases management practices, and safe & effective use of pesticides); Harvest (harvesting indices); Post-Harvest Handling (appropriate containers/standard packaging materials, and value addition techniques); and Cost and Income Analysis (cost and income analysis).
- The issues outlined in the twenty (20) sub-topics might not necessarily be applicable in all the cases. But where applicable, it is recommended that the instructions issued be given due consideration.

1. Introduction:1.1 Background

Green Pepper (Karia)

Introduction: Background

Green Pepper (Kariya)

1. Introduction:

1.1 Background

- Peppers are grown extensively under various climatic and environmental conditions
- It is an important cash crop for smallholder farmers in Ethiopia
- Peppers are widely grown in different places in Ethiopia and the fruits are consumed as fresh, dried or processed products, as vegetables, as spices or condiments.
- The crop is exported as dried ripe fruit or as oleoresin extracted from the fruits

1.2 Some Common Varieties

Information Source: http://www.awangarden.com

"Marako Fana"

1.2 Some Common Varieties

"Marako Fana"

1.2 Some Common Varieties

"Marako Fana":

- grown in open field
- Has tolerante to viral diseases which include Potato Virus Y (PVY), Tomato Mosaic, Tobacco Mosaic & Pepper Mild Mottle
- Fruit turns from green to yellow
- Maturity Period: 120–135 days after transplanting
- Yields: Open field 150– 250 qt/ha

1.2 Some Common Varieties cont...

"Melka Zala"

"Melka Eshet"

1.2 Some Common Varieties

"Melka Zala"

"Melka Eshet"

1.2 Some Common Varieties "Melka Zala"

- grown in open field
- Has tolerant to soil born diseases
- Fruit color turns green to red
- Maturity Period: 130–150 days after transplanting
- Yields: Open field 200– 250 qt/ha

"Melka Eshet"

- grown in open field
- Use for processing
- Fruit color turns green to full red
- Maturity Period: 100-120 days after transplanting
- Yields: Open field 150- 200 qt/ha

1.3 Optimal Ecological Requirements

Altitude	1,400 – 1,900 Meter Above Sea Level
Rainfall	600 – 1,200 mm of rainfall annually
Growing Temperature	25 – 28 °C day temp. 15 – 20 °C night temp.
Soils	 •Well-drained loamy soils •pH 5.5 – 7 •High organic matter

1.3 Optimal Ecological Requirements

Altitude	1400 – 1900 meter above sea level
Rainfall	600 – 1,200 mm of rainfall annually
Growing Temperature	25 – 28 °C day temp. 15 – 20 °Cnight temp
Soils	 Well-drained loamy soils pH 5.5 – 7 High organic matter

1.3 Optimal Ecological Requirements

- Altitude: Green pepper can be cultivated up to 1,400 1,900 m above sea level
- Rainfall: Greene pepper performs well in areas that receive 600 1,200 mm of rainfall annually which is well distributed throughout the growing period is required
- **Temperature:** Green pepper performs well in **warm climatic conditions**. The optimal temperature range is **21-24** °C. Lower night temperatures result in greater branching and more flowers, while warmer night temp. induce earlier flowering
- Soil: Green pepper requires light- textured fertile and well-drained soils with a high level of organic matter. Good drainage is important because waterlogging is tends to cause leaf drop. The optimal soil pH range is 5.5 –7.0

2. Pre-Cultivation Preparation:2.1 Market Survey

Carrying out a market survey on green pepper

2. Pre-Cultivation Preparation:2.1 Market Survey

Carrying out a market survey on green pepper

2. Pre-Cultivation Preparation:

2.1 Market Survey (GHCP&PHHT20: Q1)

How to conduct a market survey

- Identify major dealers of the target crops
- Introduce yourself what the purpose of a market survey
- Find the potential market nearby your area (local market, big market in town, hospital, University, boarding school)
- It is important to consider seasonal or religious event, such as Christmas or fasting
- People consume more vegetables during fasting season
- Continuous surveys are important in order to find new market opportunities and also establish business relationships with the market players.

Note: It is recommended to conduct a market survey when you go to local market during your local market day

2. Pre-Cultivation Preparation: 2.2 Market Survey Questionnaire

Market Survey Questionnaire

Date :/	
Region:	Zone:
Woreda:	Name of Group:

Name & Contact of the Produce Dealer	Produce & Variety	Produce Quality Market Require ments	Peak Demand (months)	Frequency	Place of Produ ction	Purchasi ng Unit Price (ETB/kg)	Payment	Terms of Payment	•	Dealer's Willingness to Purchase the Produce from the farmers
Mr. Abdela	Green	Large size	February	10 qt/day		30 ETB/kg	Cash	Cash on	No sorting	Willing to buy at

2. Pre-Cultivation Preparation:2.2 Market Survey

Market Survey Questionnaire

Date :	
Region	Zone
Woreda	Name of Group:

Name & Contact of the Produce Dealer	Produce & Variety	Produce Quality Market Require ments	Peak Demand (months)	Frequency	Place of Produ ction	ng	Mode of Payment	Terms of Payment		Dealer's Willingness to Purchase the Produce from the farmers
Mr. Abdela	Potato	Medium	February	120 qt/week	Waliso	3.5	Cash	Cash on	Poor quality	Willing
Qasim (0917- xxxxxx)	(Belete)	size	to March	(1qt = 100 kg)		ETB/kg		Delivery	(diseased)	
Mr. Kernal Husen (0911- xxxxxx)	Onion (Adama Red)	Big size	April to September	50 qt/day (1 qt=110 kg)		15 ETB/kg	Credit	Within a week	Poor quality (small size and not well cured)	Willing
Mr. Amir Yemane (0911- xxxxxxx)	Head Cabbage (Copenha gen Market)	Medium size	April	4 qt/week (1qt = 70kg)	Dedo	250 ETB/qt	Cash	Cash on Delivery	Poor quality (damaged and not well matured)	Willing

- 2. Pre-Cultivation Preparation:
- 2.2 Market Survey Questionnaire

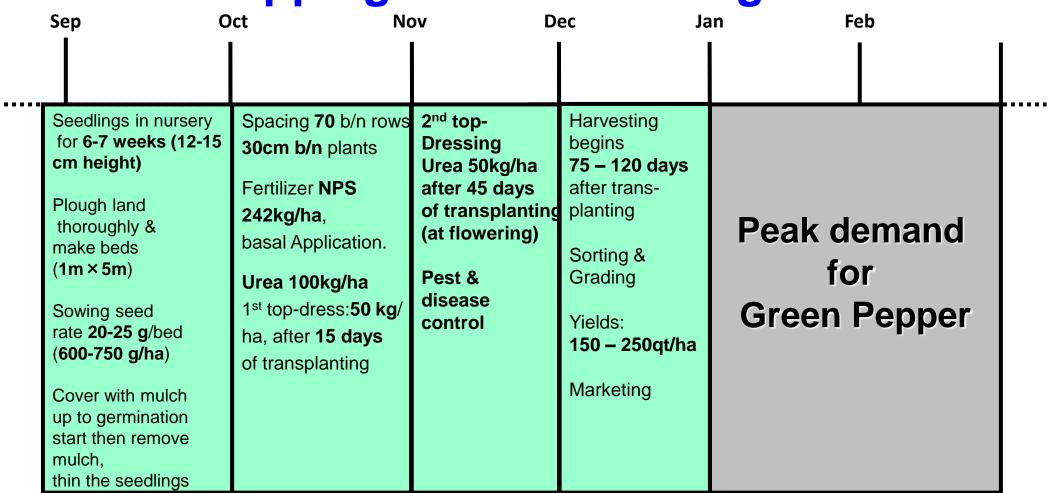

Prepare sample questions to enable you gather the following information

- When (month) is the peak demand for Green pepper
- The price of Green pepper during the peak demand
- The variety(s) that has the highest demand
- Supply requirements (quantities and frequency)
- Quality market requirements
- Potential buyers and terms of payment etc.

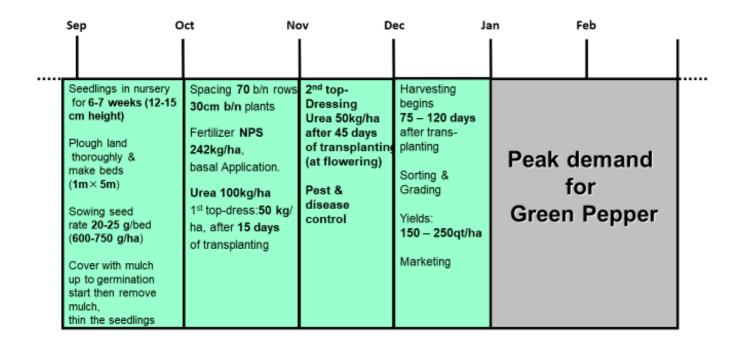

Market Survey Questionnaire

2.2 Cropping Calendar

A Sample of a Green Pepper Cropping Calendar in Irrigation

2.2 Cropping Calendar

A Sample of a Green Pepper Cropping Calendar

2.2 Crop Planting Calendar (GHCP&PHHT20: Q2)

 A tool used by farmers to plan for production to ensure that marketing coincides with the period of the year when the market price of a produce is highest

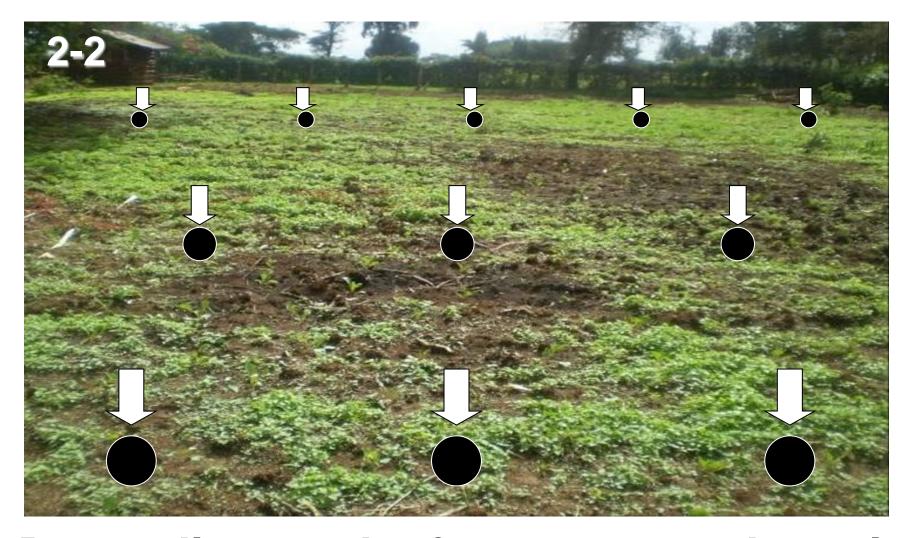

Procedure:

- 1. Determine from the market survey results (2.1) when there is peak demand for Capsicum
- 2. Work backwards from the month when there is peak demand to prepare a monthly farm activities preceding the peak period
- 3. Use the monthly activities preceding the peak as a procurement plan for farm inputs and a guide for farm operations

Notes:

 To meet the peak demand period of the market, there may be need of supplemental irrigation

2.3 Soil Sampling & Analysis

Depending on the farm, sample the soil using the most appropriate method

2.3 Soil Sampling & Analysis

Depending on the farm, sample the soil using the most appropriate method

2.3 Soil Sampling & Analysis (GHCP&PHHT20: Q3)

- It is recommended to have the soils analyzed for nutrient availability and other factors vital to crop production after every 2 – 3 years
- The results of the soil analysis can be used to determine fertilizer and manure requirement

2.4 Composting

Manure and compost preparation through composting

2.4 Composting

Manure & compost preparation through composting

2.4 Composting (GHCP&PHHT20: Q4)

- During compost making, the organic matter need to be covered to prevent leaching of nutrients
- Green pepper requires well composed manure to avoid soil borne diseases
- Application rate of **100 120 qt/ha** of compost required depending on the soil organic matter content.
- This is equivalent to 1 2 handfuls of manure per sowing hole
- It should be mixed thoroughly with the soil in the planting hole

2.5 Quality Seed/Planting Materials

Samples of certified seeds on sale

2.5 Quality Seed/Planting Materials

Samples of certified seeds on sale

2.5 Quality Seed/Planting Material (GHCP&PHHT20: Q5)

- Like any other planting material, Capsicum seed should be of high quality and certified by Seed quarantine Service which is a government agency responsible for seed certification
- Ensure you purchase seeds from certified seed companies, authorized dealers /stockiest and certified nursery
- Farmers should pay attention to information on seed label such as expiry date, spacing, storage etc.

3. Cultural Practices: 3.1 Land Preparation

Preparing land by oxen plough for transplanting
The Project for Smallholder Horticulture Farmer Empowerment through Promotion of Market-Oriented Agriculture (Ethio-SHEP) @ 2019

3. Cultural Practices:

3.1 Land Preparation

Preparing land by oxen plough for planting

- 3. Cultural Practices:
- 3.1 Land Preparation
 Land Preparation Practices:
 (GHCP&PHHT20: Q6)
- Preparation should be done 2 3 months before planting
- Soils should be ploughed sufficiently to eliminate debris and clods
- The field should be deeply ploughed to a depth of 20 – 30 cm and harrowed
- The field should not be planted with the same crop or related species (tomato, l/potato, hot/green pepper)
- For purpose of making field operations easy, beds are more convenient with closer spacing and bigger paths

3.2 Incorporation of Crop Residues

Crop residues to be incorporated in a field

3.2 Incorporation of Crop Residues

Crop residues to be incorporated in a ploughed field

3.2 Incorporation of Crop Residues (GHCP&PHHT20: Q7)

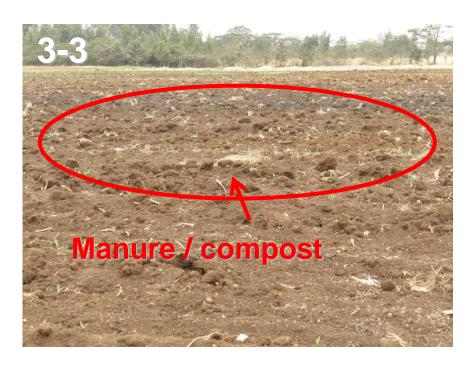

- Incorporating crop residues in the farm land can significantly increase the soil organic content
- The crop residues should be thoroughly incorporated at a depth of about 30 cm at least 1 2 months before transplanting the green pepper
- This allows for proper decomposition
- However, if the crop residues belong to the Solanaceae family (such as tomatoes, potatoes, egg plant, sweet peppers/ green pepper, chilli peppers, etc.),
- remove and burn the residue to avoid possible risk of disease build up

3.3 Basal Application

Manure & compost incorporation as a basal application

3.3 Basal Application

Manure & compost incorporation as a basal application

3.3 Basal Application (GHCP&PHHT20: Q8)

- Pepper thrive best if supplied with a generous amount of manure/compost
- Recommendation is to supply 100-120 qt/ha of compost
- Field should be ploughed frequently and leveled, then make furrows or ridges by maintaining 75cm distance between rows
- Apply 242 kg/ha of NPS fertilizer at sowing time

3.4 Raising Seedlings

Raising seedlings in seed bed

3.4 Raising Seedlings

Raising seedlings in seed bed

3.4 Raising Seedlings (GHCP&PHHT20: Q9)

- Green pepper is normally raised in nursery & transplanted but it can also be directly sown
- Seed Rate: 600 750 g/ha for the nursery and 3 kg/ha for direct sowing

Nursery Site Selection:

 The nursery should be sited in a plot that has not been planted with a member of Solanaceae family for the last 3-4 years

Nursery Establishment:

- Prepare a nursery bed of **1 m width** and 5-10m length
- Make drills on the seedbed at a spacing of 10 15 cm apart
- Thinly sow the seeds in the drills and cover lightly with soil
- Water the nursery regularly
- Prepare shade and cover with organic materials such as dry grass
- The shade protects young seedlings from exposure to sun

Management of Nursery:

- Water the nursery regularly
- Harden the seedlings 1 2 weeks before transplanting by reducing the frequency of watering and gradually exposing the seedlings to direct sunlight
- Control of whiteflies is important since they transmit viruses to young green pepper plants
- These insects can be blocked from reaching the seedlings by using an insect proof net

3.5 Transplanting

Transplanting Seedlings

Transplanted
Green pepper
plants in the field

3.5 Transplanting

Transplanting Seedlings

Transplanted pepper plants in the field

3.5 Transplanting

3.5.1 Appropriate Time

- Seedlings are transplant n the field at the 4 6 true leaf stage(15-20 cm tall), usually 6 – 7 weeks after sowing
- Hardy transplants can be produced by restricting water and removing shade protection 1 week before transplanting
- It is recommended that transplanting should be done either early in the morning or late in the evening

3.5.2 Recommended Spacing (GHCP&PHHT20: Q10)

- Plant Spacing: 60 cm × 45 cm or 70 cm × 30 cm depending on the variety
- Under irrigation, it can be planted in double row on flattopped ridges. The distance between rows will be 80cm and 40cm between plants. Double row spacing is 40cm
- Plant Population per ha: range from 34,188 to 47,619 plants.
- Appropriate spacing produces short sturdy plants with good root system

3.5.3 Fertilizer Application Rates (GHCP&PHHT20: Q11)

- The type of fertilizer and amount needed depend on soil analysis results
- Apply 200 kg/ha of DAP Or 242kg/ha of NPS during transplanting
- The fertilizer should be mixed thoroughly with the soil

3.6 Water Requirement

Watering by using furrow irrigation of pepper plants

3.6 Water Requirement

Watering by using furrow irrigation of pepper plants

3.6 Water Requirement (GHCP&PHHT20: Q12)

- Green pepper requires adequate moisture during growing period
- They can be grown under rain-fed or irrigated conditions
- Watering will encourage green pepper plants to produce high quality and quantities of fruit
- Avoid watering plants in the evening as wet plants are more likely to develop disease
- Soils should be well drained
- Root depth can extend up to 1.0m but under irrigation condition roots are mainly concentrated in the upper 0.3 m soil depth.

Irrigation Methods:

- Furrow irrigation are the most effective methods minimizes spread of diseases, such as "Bacterial wilt" as compared with overhead irrigation
- In the early growth stage, irrigate water 5-7 days interval
- At latter growth stage, it might extend up to 7-10 days interval

3.7 Managing of Weeds

Weed management of Pepper field using appropriate tool

3.7 Managing of Weeds

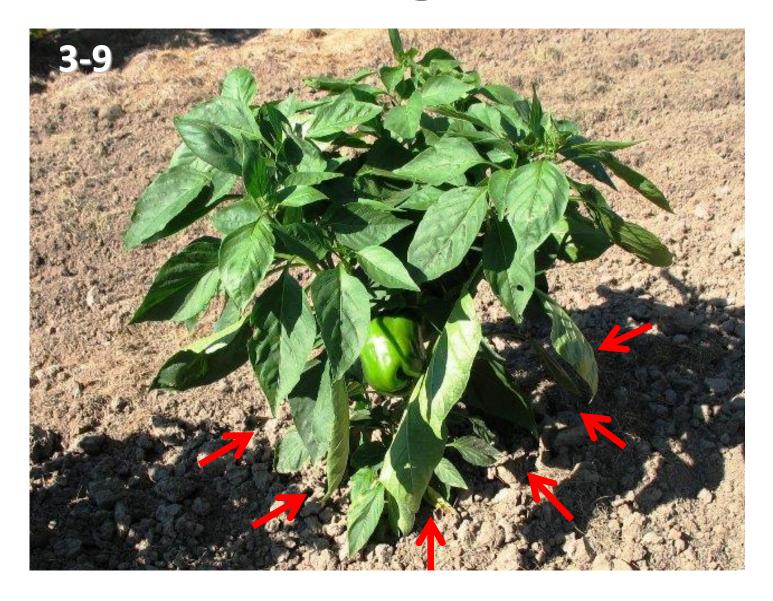

Weed management of Pepper field using appropriate tool

3.7 Managing of Weeds (GHCP&PHHT20: Q13)

- Generally, keep the field weed free as much as possible to avoid competition for nutrients, sunlight and moisture
- Avoid bruising the roots during weeding
- This can be done through use of appropriate weeding tools
- Pepper is susceptible to weed competition, particularly at the early stage of growth
- To control weed and loosen the soil cultivating should be done 3-4 times until flowering starts.
- 1st weeding: after 20 days of transplanting
- 2nd weeding: after 40 days of transplanting
- Organic mulches are very effective for weed control

3.8 Top-dressing

Top-dressing using the placement method

3.8 Top-dressing

Top-dressing using the placement method

3.8 Top-dressing (GHCP&PHHT20: Q14)

- Green pepper crop should be top-dressed with organic and inorganic chemical fertilizers (Urea) to produce high yields
- 1st top-dressing is done with urea 50 kg/ha,
 2 3 weeks after transplanting
- 2nd top-dressing is done with urea 50 kg/ha,
 6 weeks after transplanting (at flowering
- During flowering high amounts of nitrogenous fertilizer should be avoided

3.9 Crop Management 3.9.1 Training & Staking

Information Source: http://galleryhip.com

Information Source: http://www.limurufarmadn.org

Well trained & staked pepper field

3.9 Crop Management3.9.1 Training & Staking

Well trained & staked Green pepper field

3.9 Crop Management 3.9.1 Training and Staking

- Staking keeps the plants upright and also keep the fruit away from the soil
- Staking materials: Wood stakes, bamboo or any sturdy material
- Strings, plastic strips or other material can be used for training the plant to the stake
- It keeps the canopy intact, thus preventing sunscald on the fruit
- It also prevents the plant from splitting during a heavy fruit load
- Staking can help minimize lodging

3.9.2 Pruning

Information Source: http://www.aerogarden.com

Pruning of green pepper plant

Information Source: http://www.aerogarden.com

After pruning

3.9.2 Pruning

Pruning of green pepper plant

After pruning

3.9.2 Pruning

- Green pepper plants initially develop one single stem
- Later more shoots develop
- Each shoot will branch further after one or two leaves, while producing flower buds at the point of division
- The most common way of growing Green pepper is to facilitate development of two main shoots
- If three or four main shoots are required, the third and fourth must normally be taken from the second branching
- Side shoots should have equal vigor

Note: whether farmer needs to practice pruning is depends on the variety and quality that farmers want to achieve.

3.9.3 Control Flower Load

Information Source: http://4.bp.blogspot.com

Buds

Information Source: http://bonnieplants.com

Flowers

3.9.3 Control Flower Load

Buds

Flower

3.9.3 Control Flower Load

- Green pepper starts flowering about 2 3 weeks after planting
- The first flower can be removed
- Later flowers may develop into fruit
- Sufficient leaf area must have developed for one to allow the plants to carry the fruits
- Plants with 3 or 4 axils above the branching are big enough to be allowed to set fruit
- Young plants fruit load must be controlled by the grower, in order to achieve a reasonable fruit weight

3.10 Pests & Diseases Control

3.10.1. Control/Management Strategies

1. Cultural Control 2. Mechanical Control 3. Biological Control 4. Chemical Control **Integrated Pest Management**

3.10 Pests & Diseases Control 3.10.1 Control/Management Strategies

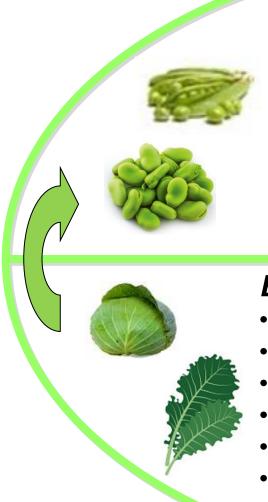

1.	Cultural Control
2.	Mechanical Control
3.	Biological Control
4.	Chemical Control
5.	Integrated Pest Management (IPM)

3.10 Pests & Diseases Control

3.10.1 Control/Management Strategies (GHCP&PHHT20: Q15)

- Pests and diseases can be managed through either single control strategies or an integration of two (2) or more methods.
 The single control strategies are: cultural; physical; biological; and chemical.
- 1. **Cultural Control:** This involves managing the environment in which the crop is growing/grows with a view of maintaining pest and disease below the harmful level. The cultural methods include: field sanitation/hygiene, intercropping, crop rotation, furrowing, flooding, solarization etc.
- **2. Mechanical Control:** This involves use of insect traps, hand picking, screening house, weeding etc.
- **3. Biological Control:** This involves use of natural enemies (predators and parasitoids), resistant/tolerant varieties, trap plants, push and pull system, and repellant plants
- 4. Chemical Control (GHCP&PHHT20: Q16): This involves use of pesticides. Pesticides are preferred because of the quick knock down effect; they have high efficacy. Pesticide usage has been linked to environmental degradation and should be used as last resort
- 5. Integrated Pest Management (IPM): Due to limitation of a single control strategy, use of IPM is a more recommended strategy. IPM integrates cultural, mechanical, biological and as a last resort, chemical control to minimize the crop loss caused by pests and diseases.

3.10.2 Crop Rotation

Leguminosae

- Garden Peas
- Snow Peas
- Faba beans
- Haricot beans
- Soya bean

Alliaceae

- Bulb Onion
- Shallot
- Leek
- Garlic

Brassicaceae

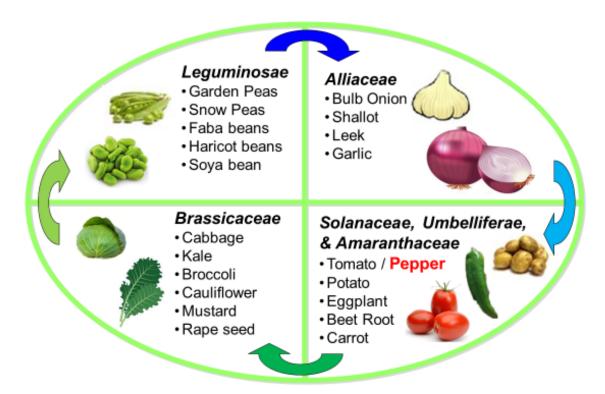

- Cabbage
- Kale
- Broccoli
- Cauliflower
- Mustard
- Rape seed

Solanaceae, Umbelliferae, & Amaranthaceae

- Tomato / Pepper
- Potato
- Eggplant
- Beet Root
- Carrot

3.10.2 Crop Rotation

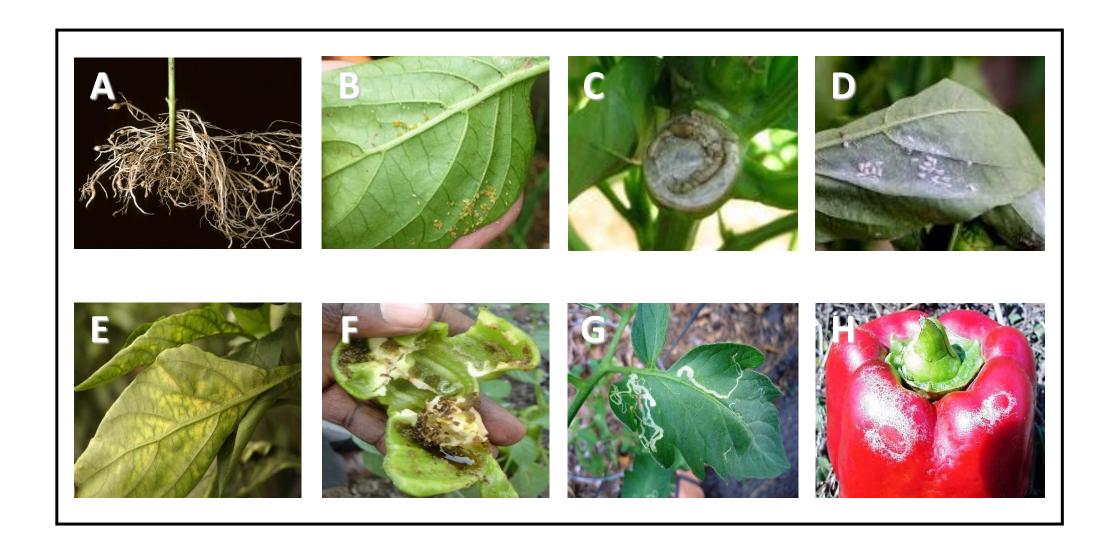

3.10.2 Crop Rotation

- One of the most important strategies of IPM is crop rotation
- Crop rotation prevents pest and disease build-up and in addition, it replenishes soil nutritional status
- It is recommended to rotate crops with those from different families; an effective rotation program should last for 3 – 4 years

An example of a Crop Rotation

3.10.3 Insect Pests

3.10.3 Major Pests

3.10.3 Major Pests

- Pests damage causes a reduction in quality and quantity of produce
- The following are the major pests of green pepper in Ethiopia:
 - A. Root-Knot Nematode
 - B. Aphid
 - C. Cutworm
 - D. White Fly
 - E. Spider Mite
 - F. Fruit Borer
 - G. Leaf Miner
 - H. Thrips

3.10.3.A: Root-knot Nematode

Information Source: https://extension.umass.edu

Information Source: https://extension.umass.edu

Symptom of "Root-knot Nematode" on roots and plants

3.10.3.A: Root-knot Nematode

Symptom of fruit damaged by "African Bollworm"

3.10.3.A: Root-knot Nematode

- Nematodes are soil inhabitants which are easily spread by infested seedlings, soil washed down the slopes or by farmers
- Root–knot Nematodes are most serious on light sandy soils

Identification:

- Small lumps or galls develop on the infected roots
- The galls on green pepper are much smaller than those on cucurbits or Tomato

Damages:

- Wilting of plants
- The plant roots can be seen to be distorted, swollen and bearing galls (knots)
- The infested roots eventually rot and affected plants die

- Crop rotation
- Mixed cropping with African Marigold
- Maintaining high levels of organic matter in the soil
- Use some bio products e.g.) Neem extracts

3.10.3.B: Aphid

Information Source: http://farm4.static.flickr.com

Aphids on a leaf

3.10.3.B: Aphid

Aphids on a leaf

3.10.3.B: Aphid

Identification:

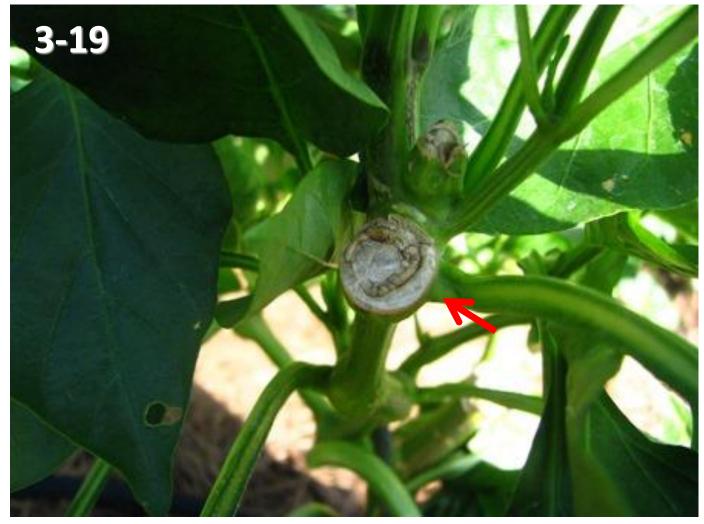

- Aphids occur in colonies initially around tender plant parts and on the lower leaf surface
- When numerous, they can be found on all above ground parts of the plant

Damages:

- Aphids damage plants by sucking their sap, excreting a sticky substance (honeydew) that coats the plants, or/and by transmitting viral diseases
- Curling, wrinkling, or cupping of young leaves, chlorotic spotting, mottling of older leaves, stunting and wilting of plants
- Growth of sooty mould on honeydew excreted by aphids reduces photosynthesis and affects fruit quality

- Naturally controlled by predators, such as ladybird, beetles, hoverflies, anthocorid bugs, spiders and lacewings and by fungal diseases
- Spraying gelatin solution (before the population increased) is also effective.
- Spray with insecticides,
- such as :diamethoate 40% WP, cruser 240 SC(Sulafoxaflor),phonix 5% Ec

3.10.3.C: Cutworm

Information Source: https://gardendishes.files.wordpress.com

Cutworm on the stem

3.10.3.C: Cutworm

Cutworm on the stem

3.10.3.C: Cutworm

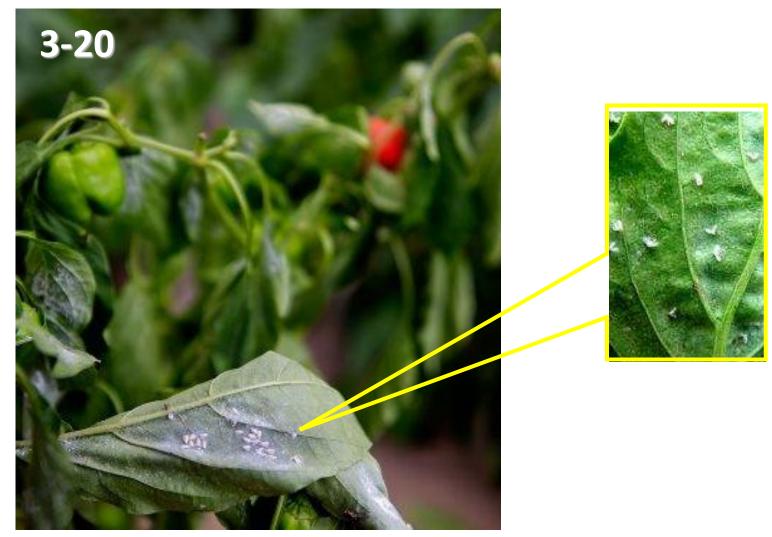

- Cutworms are the caterpillars of various moths
- They drop to the soil where they live until pupation
- They hide during the day in the soil around the base of the plants and climb into plants at night

Damages:

- Young caterpillars feed on leaves making small holes
- Cutting stems of young seedlings at the level of the soil

- Eliminate weeds early, well before transplanting
- Plough and harrow the field to expose Cutworms to natural enemies and desiccation 3 – 4 weeks before transplanting is done
- Dig near damaged seedlings and destroy them
- Conserve natural enemies: Parasitic wasps and ants are important in natural control of Cutworms
- Drench the soil with;
 - Actara 25 WG ® (a.i. Thiamethoxam)
 - Alfa Cymba 10 EC® (a.i. Alphacypermethrin)
 - Alfacyper M® (a.i. Alpha-cypermethrin)

3.10.3.D: White Fly

Information Source: http://www.pbase.com & http://www.infonet-biovision.org

White Flies on a leaf

3.10.3.D: White Fly

White Flies on a leaf

3.10.3.D: White Fly

Identification:

- Whiteflies are soft-bodied, winged insects closely related to aphids
- They can be as small as 1/12 of an inch, and are often found in **clusters** on the undersides of leaves
- They are active during the daytime
- Whiteflies are capable of over wintering and reproducing throughout the year in warmer climates

Damages:

- Whitefly immature stages (nymphs) and adults suck sap from leaves producing chlorotic spots on infested leaves
- Nymphs excrete a clear sugary liquid known as honeydew, which proliferate the growth of a black sooty mould, affecting photosynthesis
- Whiteflies are vector of important viral diseases, such as Chili Leaf Curl

- Keep the seedlings protected under a fine meshed insect netting until they are ready for transplanting
- Make sure the netting is always properly closed
- **Use of traps** with yellow polyethylene with a sticker to attract the insects
- Conserve natural enemies: Parasitic Wasps, Predatory Mites, Ladybird & Lacewings
- Spray with insecticides, such as
 - Applaud 40%SC® (a.i Bufrofezin)
 - Actara 25 WG® (a.i. Thiamethoxam 250 g/kg)
 - Karate 2.5 WG® (a.i. Lambada Cyhalothrin 25 g/kg)

3.10.3.E: Spider Mite

Information Source: https://www.worldofchillies.com/growing_chillies/chilli_pests_problems_diseases/chilli_pests/chillipests.html

Symptoms of spider mites on a green pepper leaf

3.10.3.E: Spider Mite

Source: https://www.sgaonline.org.au/red-spider-mite/

Symptoms of spider mites on a pepper leaf

3.10.3.E: Spider Mite

Identification:

- Adults are oval and have eight legs
- They are **very tiny** (0.5 mm) resembling **tiny moving dots**
- They vary in colour depending on the species
- Many of the species are bright red in colour, others are yellowish, greenish, pinkish, orange or reddish
- The Two-spotted Spider Mite has a large dark blotch on each side of the body

Damages:

- Spider Mites suck the sap of the plants, causing mottling of the upper leaf surface
- Infested leaves first show a white to yellowing speckling, and then eventually turn bronze and fall off as the infestation becomes heavy
- Spider Mites prefer the lower surface of the leaves, but in severe infestations occur on both leaves surfaces as well as on stems and fruits
- High infestations cause defoliation

- Field hygiene is important for the management of Spider Mites
- Conserve natural enemies, such as Predatory Mites
- Chemical sprays using miticides, such as
 - Dynamic 1.8 E.C.® (a.i. Abamectin)
 - Agrimec 18 EC® (a.i. Abamectin)
 - Thiovit Jet® (a.i. Sulphur) where possible while observing the pre-harvest interval

3.10.3.F: Fruit Borer

3.10.3.F: Fruit Borer

Pepper fruit showing Fruit Borer attack

Newly laid egg

Male adult moth

3.10.3.F: Fruit Borer

Identification:

- Fruits Borers (Bollworms) are about 2 3.5 cm long
- Moths are active at dusk and at night
- Moths of Fruit Borers, feed on nectar and lay eggs on leaves

Damages:

- Some species feed on leaves causing defoliation and slow plant growth
- Attack on flower buds results in flower abortion
- Caterpillars usually bore holes in fruits, causing extensive damage and promoting decay from secondary infection by diseases

- Check the crop regularly (scouting)
- Plough the soil before planting
- Handpick and destroy damaged fruits, eggs and caterpillars
- Conserve natural enemies: Parasitic Wasps, Ants, Pirate Bugs etc.
- Scouting the crop in order to detect eggs or larvae before they bore into the fruit
- **Use trap crops**, such as tasseling maize for ovipositing adult females
- Use bio-pesticides, such as **Bacillus thuringinesis (Bt)**, **neem products** or other plant extracts
- Spray insecticides, such as
 - Karate 2.5 WG® (a.i. Lambda Cyhalothrin)
 - Halothrin 2.5 EC® (a.i. Lambda Cyhalothrin) during fruit set

3.10.3.G: Leaf Miner

Information Source: http://quailshollarfarm.blogspot.com

Information Source: http://quailshollarfarm.blogspot.com

Leaf Miner damage on a leaf

3.10.3.G: Leaf Miner

Leaf Miner damage on a leaf

3.10.3.G: Leaf Miner

Identification:

- Female flies make numerous small, whitish tunnels (mines) on the foliage when feeding and depositing eggs
- Full-grown maggots come out of the mines to pupate in the soil beneath the plants or on the foliage
- Maggots are the most destructive stage

Damages:

- The females lay eggs that hatch into tiny yellow maggots which feed on leaf tissues leaving a wandering track (whitish tunnels) known as mines
- The mines may reduce photosynthetic activity, affecting development of flowers and fruits
- These tunnels can serve as entry points for disease-causing organisms
- Completely mined leaves might dry up and fall off prematurely
- Wilting of plants leading to fruit sunscald, death of the young plants and yield loss

- Ploughing and solarization can help in exposing pupae to desiccation and natural enemies
- Conserve natural enemies
- Neem products are effective for controlling Leafminers
- Use of Systemic chemicals and observe PHI
- Spray insecticides, such as
- Dynamic 1.8 E.C.® (a.i. Abamectin)
- Agrimec 18 EC® (a.i. Abamectin)
- Applaud® (a.i Buprofezin)

3.10.3.H: Thrips

Information Source: http://www.pestnet.org

Information Source: http://www.omafra.gov.on.ca

Information Source: http://www.pestnet.org

Thrips marks on green pepper leaves and fruit

3.10.3.H: Thrips

Thrips marks on Capsicum leaves and fruit

3.10.3.H: Thrips

Identification:

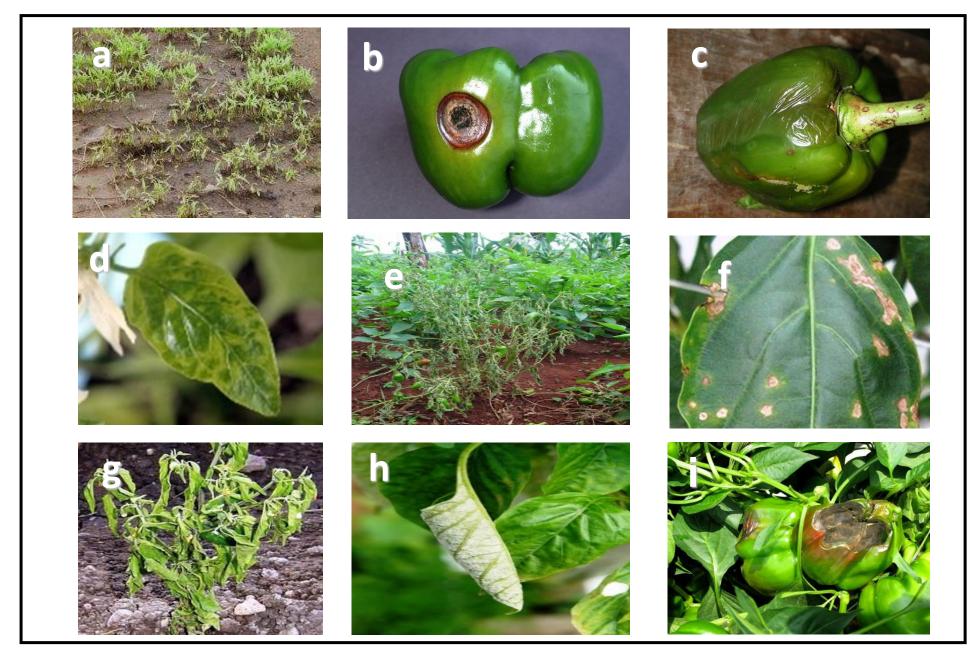

- Often concealed under the calyx
- Thrips usually feed on all above ground parts of plants preferring the underside of young leaves, flowers and fruits

Damages:

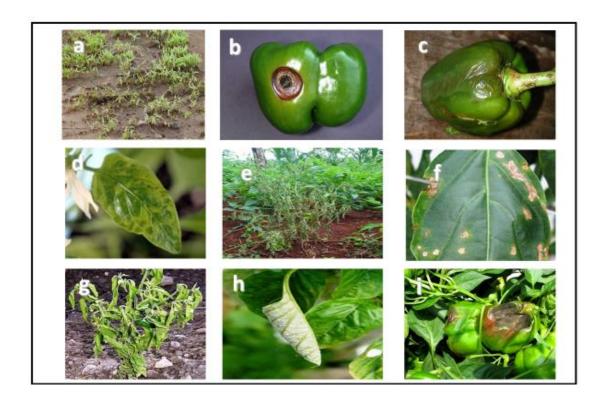

- Thrips puncture leaves and suck the exuding sap
- At the initial stage of infestation, leaves have a silvery sheen and show small, dark spots of faecal material on the underside
- Later leaves curl upward, wrinkle and finally dry up leading to fruit sunscald
- Damaged leaves, buds and fruits turn rusty in colour
- Wilting, retardation of leaf development and distortion of young shoots resulting in stunted plants
- Attack on fruits causes deformation and scarring of the fruits
- Thrips transmit the Tomato Spotted Wilt virus and Leaf Curl disease

- Conserve natural enemies, such as Anthocorid Bugs, Predatory Mites and Spiders
- Spray insecticides, such as
 - Tracer 480 SC® (a.i. Spinosad)
 - Achook® (a.i. Azadiractin)
 - Vendex 500 EC® (a.i. Lambda Cyhalothrin 5%EC)
 - Thunder OD 145® (a.i. Imidacloprid+Betacyfluthrin)

3.10.4 Diseases

3.10.4 Diseases

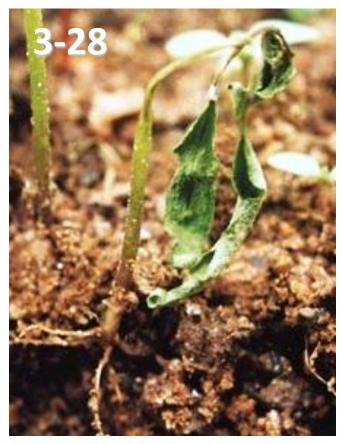

3.10.4 Diseases

- Disease infestation leads to reduction in quality and quantity of produce
- The following are the major diseases of Capsicum in Ethiopia:
 - a. Damping-off
 - b. Anthracnose
 - c. Bacterial Soft Rot
 - d. Viral Diseases
 - e. Bacterial Wilt
 - f. Leaf Spot
 - g. Fussarium Wilt
 - h. Powdery Mildew
 - i. Blossom End Rot

3.10.4.a: Damping-off

Information Source: http://www.infonet-biovision.org

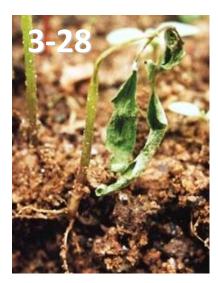

Information Source: http://www.stclareseeds.com

Green pepper seedlings showing symptoms of Damping-off

3.10.4.a: Damping-off

Green pepper seedlings showing symptoms of Damping-off

3.10.4.a: Damping-off

General Descriptions:

- This disease is soil borne caused by fungi
- There are 2 types of Damping-off:
 - Seedlings fail to emerge (Pre-emergence Damping-off)
 - Small seedlings collapse (Post-emergence Damping-off)

Symptoms:

- Seedlings are stunted through root rot and/or collar rot
- Nursery beds show irregular patches
- Leaves: lesions, abnormal colours, abnormal forms, wilting, fungal growth
- Roots: lesions
- Seeds: rot, discolorations
- Stems: external discoloration, canker, abnormal growth, mycelium visible
- Whole plant: plant death, dieback, damping-off

- Growing certified disease-free seed
- Nursery beds be located on well drained sites, not previously under vegetable production
- Proper watering regime
- Use of **appropriate fungicides** as spray or soil drench, such as
 - Ridomil Gold MZ 68 WG® (a.i. Metalaxyl + Mancozeb)
 - ApronStar 42 WS® (a.i. Thiamethoxam + Metalaxyl + Difenoconazole)

3.10.4.b: Anthracnose

Information Source: http://www.omafra.gov.on.ca

Information Source: http://www.omafra.gov.on.ca

Anthracnose affected on the green pepper fruits

3.10.4.b: Anthracnose

Anthracnose affected on the green pepper fruits

3.10.4.b: Anthracnose

General Descriptions:

- Anthracnose is caused by Colletotrichum spp.
- Spores dispersed by water-splash, air currents, insects or other forms of contact
- Transmitted through seed, but also through infected plant parts
- Persists on and in seed, crop residues, and weed hosts

Symptoms:

- Dark, sunken spots up to 2.5 cm across on green pepper
- The spots on green and ripe fruits surface may be covered in moist weather with salmon-pink mass of spores

- Use certified disease-free seeds
- Practice field sanitation (removal of crop debris after harvest)
- Application of registered fungicides, such as
 - Daconil 720 SC® (a.i. Chlorothalonil)
 - Bravo 720 SC® (a.i. Chlorothalonil)
 - Cuprocaffaro® (a.i Copper Oxychloride)

3.10.4.c: Bacterial Soft Rot

Information Source: http://www.omafra.gov.on.ca

Information Source: https://extension.umass.edu

Bacterial Soft Rot affected on green pepper fruits

3.10.4.c: Bacterial Soft Rot

Bacterial Soft Rot affected on green pepper fruits

3.10.4.c: Bacterial Soft Rot

General Descriptions:

- The bacteria are soil-borne
- Soft Rot is primarily a post-harvest problem
- The disease is serious during rainy periods
 because the bacteria are splashed from the soil onto
 the fruit, which are more susceptible due to their high
 moisture content
- The disease begins in the peduncle and calyx tissues of harvested fruit

Symptoms:

- Fruit infected on the plant collapses and hangs on the plant like a water-filled bag
- When the contents leak out, a dry shell of the fruit remains

- Crop rotation with pulses and cereals
- Control of insects that cause injury to fruits
- Post-harvest decay can be reduced by harvesting fruits when dry
- Minimize injury during handling
- Store at cool temperatures

3.10.4.d: Viral Diseases

Information Source: http://greenindustry.uwex.edu

Information Source: http://pnwhandbook.org

Cucumber Mosaic Virus infection

Alfafa Mosaic virus infection

3.10.4.d: Viral Diseases

Cucumber Mosaic Virus infection

Alfafa Mosaic virus infection

3.10.4.d: Viral Diseases

General Descriptions:

- Cucumber Mosaic Virus (CMV) is the most important world wide
- Other viral diseases include Alfalfa Mosaic Virus (AMV), Tobacco Mosaic Virus (TMV), Tomato Spotted Wilt Virus (TSWV), Pepper Mottle Virus (PeMV), Potato Virus Y (PVY), Tobacco Etch Virus (TEV)
- Most of these viruses are transmitted by insects such as aphids, infected seed and a few by mechanical

Symptoms:

- Difficult to firmly diagnose by symptoms as they can be altered by factors like cultivar, age of host plant, environmental conditions, host plant nutrition and viral strains, not to mention the occurrence of virus mixtures
- Some symptoms are; mosaic patterns on leaves, yellowing, ring spots, leaf deformation or distortion, curling of leaves, and/or stunting of plants
- Also, reduction of fruit size, distortion, and/or ring patterns could be seen

- Use barrier crops to minimize virus spread
- Use oil sprays to reduce virus transmission by Aphids
- Use reflective mulches (silver colored) to repel Aphids and Thrips
- Field hygiene & Crop rotation
- Destruction of alternative hosts
- Control the insect vectors

3.10.4.e: Bacterial Wilt

Information Source: http://www.infonet-biovision.org

Information Source: http://www.infonet-biovision.org

Bacterial Wilt attacked on a green pepper plants

3.10.4.e: Bacterial Wilt

Bacterial Wilt attacked on a green pepper plants

3.10.4.e: Bacterial Wilt

General Descriptions:

- The bacteria attack a wide range of crops and solanaceous weeds and can survive in the soil for long periods
- It is favored by wet, warm conditions
- Cross sections cut from roots and lower stems of diseased plants exude milky streams of bacteria from the vascular system when suspended in water

Symptoms:

- Wilting of the entire plant with no leaf yellowing
- Leaf spots of various shapes
- Grows as a sooty to **dark mold** on the underside of leaves. On very humid conditions, it appears on the top surface
- High infection causes foliage to roll, wilt and fall off

- Rouging of infected plants
- Control Root-knot Nematodes since they could facilitate infection and spread of Bacterial Wilt
- Soil amendments (organic manures)
- Crop rotation to avoid continuous planting of Solanaceous crops
- Proper irrigation management

3.10.4.f: Leaf Spot

Information Source: http://www.monsanto.com

A health leaf (left) & Cercospora Leaf Spot lesions on a leaf (right)

3.10.4.f: Leaf Spot

A health leaf (left) & Cercospora Leaf Spot lesions on a leaf (right)

3.10.4.f: Leaf Spot

General Descriptions:

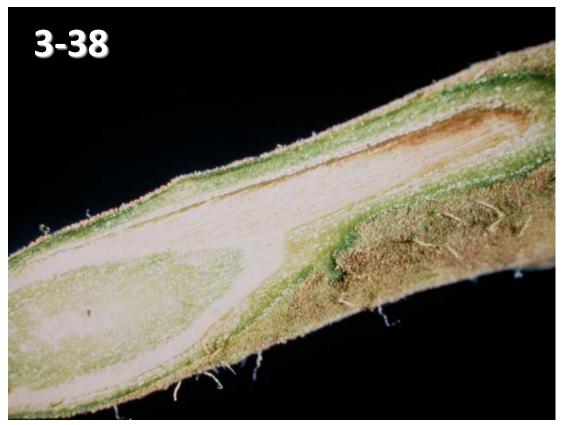

- The fungus survives on seeds and in crop debris
- The disease is favored by prolonged periods of wetness

Symptoms:

- Spots on leaves are brown and circular with small to large light grey centers and dark brown margins
- Spots on stems, petioles and peduncles are typically elliptical with same characteristic color

- Use certified seeds
- Maintain adequate soil moisture, especially at fruit development stages
- Carry out soil liming in calcium deficient soils
- Top-dress with CAN and ensure adequate soil moisture
- Spray the crop with calcium chloride
- Practice field sanitation
- Spray copper based fungicides, such as
 - Oshothane Plus WDG® (a.i. Mancozeb)
 - Penncozeb 80 WP® (a.i. Mancozeb)

3.10.4.g: Fusarium Wilt

Information Source: http://www.missouribotanicalgarden.org

Information Source: http://blog.pennlive.com

Fusarium Wilt distracted green pepper plants in the field

3.10.4.g: Fusarium Wilt

Fusarium Wilt distracted green pepper plants in the field

3.10.4.g: Fusarium Wilt

General Descriptions:

- The fungus lives indefinitely in the soil
- It is spread by irrigation water
- It is very susceptible to changes in temperature and soil moisture
- It is serious in poorly drained fields

Symptoms:

- Drooping and yellowing of lower leaves followed by wilting of the entire plant
- Leaves on infected plants remain attached and the vascular system of the plant is discoloured, particularly in the lower stem and roots

- Crop rotation
- Lime the soil (soil pH 7.0 7.5 reduces fusarium wilt disease)
- Ensure the soil has a good drainage
- Apply soil antagonist Trichotech® (a.i. Trichoderma spp)

3.10.4.h: Powdery Mildew

Information Source: http://www.plantmanagementnetwork.org

Information Source: http://hawaiiplantdisease.net

Leaves showing the initial sporulation

3.10.4.h: Powdery Mildew

Leaves showing the initial sporulation

3.10.4.h: Powdery Mildew

General Descriptions:

- The disease is caused by a fungus
- It is favored by warm, humid and dry weather

Symptoms:

- Yellowish blotches or spots with a white to grey powdery fungal growth appear on the upper leaf surface
- The disease progresses from the older to younger leaves shedding the foliage
- Leaf defoliation leads to reduction in size and number of fruits

- Apply preventive fungicides, such as
 - Thiovit Jet® (a.i. Sulphur)
 - Cosavet DF® (a.i. Sulphur)
 - Milraz WP 76® (a.i. Propineb + Cymoxanil)
 - Score 250 EC® (a.i. Difenoconazole) at the onset of disease symptoms
- Remove and destroy crop debris after harvest

3.10.4.i: Blossom End Rot

Advanced Blossom End Rot symptoms on green pepper fruits

3.10.4.i: Blossom End Rot

Advanced Blossom End Rot symptoms on green pepper fruits

3.10.4.i: Blossom End Rot

Symptoms:

- The end of the fruit becomes off-whitish to brown in color and takes on a "sunken in" appearance
- As the fruit matures, these symptoms become more pronounced and the color of the rot becomes dark brown to almost black

- Boost the soil with calcium by adding lime,
 CAN, dolomite, gypsum or composted animal manures before planting the seedlings
- Water regularly: Green pepper continue to flower and bear fruit for prolonged periods of time, so ensure the soil around their roots is kept moist
- Avoid fertilizers with a high nitrogen content: Nitrogen fertilizers will promote leaf growth at the expense of fruit, allocating calcium to the leaves instead of to the fruit

4. Harvest

Harvesting of green pepper

4. Harvest

Harvesting of green pepper

4. Harvest

4.1 Harvesting Indices (GHCP&PHHT20: Q17)

- Maturity period range between 2 3 months after transplanting
- Green pepper fruit can be harvested when they are harvestable-green
- Green fruit are incapable of ripening after removal from the plant
- The right stage for red fruit is when they have reached full colour, filled out, still firm, sticky and thick walled

Harvesting Method:

- Since green pepper have soft pliable thin flesh, care should be taken during harvesting
- Use clean knife or scissors to harvest the fruits
- Fruits should be harvested early in the morning when it is cool since the fruit temperature is low
- Harvested fruit should be kept in a cool, shaded and ventilated area in order to minimize heat gain
- Yield on open field: 150-250 qt/ha

5. Post-Harvest Handling

Harvested green pepper in the field

5. Post-Harvest Handling

Harvested green pepper in the field

5. Post-Harvest Handling

- 5.1 Containers & Packaging Materials (GHCP&PHHT20: Q18)
- Harvested green peppers are packed into plastic crates then transported to markets
- 5.2 Value Addition Techniques: Cleaning, Sorting, Grading, & Processing (GHCP&PHHT20: Q19)

Sorting:

Eliminate all fruits harvested with defects

Grading:

 Grade green pepper based on its uniform color, maturity, shape and size

5. Post-Harvest Handling Cont'

Harvested Green pepper packed into a box

5. Post-Harvest Handling Cont'

Harvested green pepper packed into a box

5.3 Storage

 Harvested green pepper should be placed in the shade immediately to avoid water loss, sunscald, and heat damage

5.4 Transportation

- The cargo should be secured during transportation
- The container should be clean, cool, dry and with good ventilation

A sample sheet of items and activities to be considered for determining an enterprise's gross margin

7. Cost & Income Analysis

- •Farmers are encouraged to keep accurate records of all enterprise activities (GHCP&PHHT20: Q20)
- •This is vital in determining the enterprise profitability
- •Record keeping is very important for farmers practicing commercial agriculture

There are 2 types of records:

•Individual Records:

- Kept by individual farmers and include the cost of production and sales
- Useful in analyzing whether the farmer is making profit or losses in his farming enterprise
- Records are very important for traceability of produce

•Group Records:

 Include activities such as group purchase of inputs, selling of produce etc.

7. Post-Training Evaluation Exercise

QUESTION	YES	NO
1. Green pepper fruits have a mild flavor and are rich in Vitamin A & C.		
2. "Mareko Fana" is the most popular variety in Ethiopia .		
3. Market survey enable buyers to understand the price of green pepper during the peak demand.		
4. Green pepper planting should time the peak market demand.		
5. Land preparation should be done 2 – 3 weeks before planting.		
6. Crop rotation prevents pest and disease build-up.		
7. Green pepper has very few pests.		
8. "Bacterial Soft Rot" is seed-borne and primarily a pre-harvest problem.		
9. Green pepper should be cooled immediately after harvest to avoid heat damage.		
10. Grading is one of the value addition techniques which farmers can do right after the harvest.		

7. Post-Training Evaluation Exercise

* Please ask the farmers to appropriately indicate answers to each of the following questions.

PAGE NUMBER	QUESTION		NO
1/46	1. Green pepper fruits have a mild flavor and are rich in Vitamin A & C.	✓	
2/46	2. "Mareko Fana" is the most popular variety in Ethiopia .	/	
5/46	3. Market survey enable buyers to understand the price of green pepper during the peak demand.		/
6/46	4. Green pepper planting should time the peak market demand.	✓	
10/46	5. Land preparation should be done 2 – 3 weeks before planting.		/
22/46	6. Crop rotation prevents pest and disease build-up.	✓	
23/46	7. Green pepper has very few pests.		/
35/46	8. "Bacterial Soft Rot" is seed-borne and primarily a pre-harvest problem.		•
42/46	9. Green pepper should be cooled immediately after harvest to avoid heat damage.	/	
43/46	10. Grading is one of the value addition techniques which farmers can do right after the harvest.	/	

[Note]

• If there is any question which half of the participants gave the wrong answer, you need to repeat the specific area regarding to question
